Messrs. TOOGOOD & SONS, Southampton, put up a fine exhibit of vegetables.

W. H. MYERS, Esq., filled a table with Apples of exceptional colour, arranged with foliage.

BOTANICAL SOCIETY OF EDINBURGH.

NOVEMBER 14.—The first meeting of the Botanical Society of Edinburgh for the session 1912-13 was held on the above date at 5, St. Andrew Square. Dr. A. W. Borthwick, the retiring president, occupied the chair. Sir Archibald Buchan-Hepburn was elected president for the ensuing session. Mr. W. W. Smith was appointed honorary secretary.

The following communications were read:—Mr. E. Holmes Smith, B.Sc., gave a preliminary note on the occurrence of mucilage on the roots of Melastomaceæ; Mr. R. C. Davie, M.A., B.Sc., described the microscopic structure of the leaves of certain Australian Banksias; Dr. Malcolm Wilson gave a preliminary account of a disease in Plums caused by a Cladosporium. A paper explaining the structure of the embryo of Laguncularia racemosa, a Combretaceous Mangrove plant, was read on behalf of Professor Bayley Balfour.

Among the exhibits shown to the members was a series of interesting casuals collected in the neighbourhood of Edinburgh by Mr. James Fraser.

The following plants, new or uncommon, in cultivation were shown from the Royal Botanic Garden, Edinburgh:—

Arenaria picta, Sibth. et Sm., from Asia Minor and Syria.—A pink-flowered species, resembling Tunica Saxifraga.

Cyananthus Forrestii, Diels, a new species from Yunnan.—A small-flowered species with pale lavender flowers and graceful habit.

Erodium Stephanianum, Willd., Eastern China.—A plant of the shores with dark purple flowers.

Gentiana gentilis, Franch., from Yunnan.—An annual free-flowering Gentian with purple-blue flowers.

Lobelia taliensis, Diels, a new species from Yunnan.—Small growing with purple-blue flowers.

Primula pseudocapitata, Ward.—A new undescribed species from Yunnan with rotate capitula, resembling P. capitata, but much smaller.

Psilostrophe Tagetinæ, Kuntze.—A beautiful yellow-flowered Composite from the Southern United States.

Saxifraga turfosa, Eng. and Irmscher.—A new yellow-flowered species from Yunnan allied to S. diversifolia and S. parnassifolia, but distinguished by its long stolons.

Saxifraga sp.—A new Yunnan species with yellow flowers, allied to S. cinerascens, Franch.

Selago spuria, Linn.—A free-flowering, white-flowered species from South Africa.

Stylidium articulatum, R.Br., Australia.—One of the riband-leaved rosette forms of the genus.

Swertia angustifolia, Ham.—A delightful pale lavender-flowered species with spotted petals from the Himalaya.

There were also exhibited specimens of the Tulip disease (Sclerotinia parasitica) and some new Chinese Compositæ collected by Mr. G. Forrest in Yunnan, including the following interesting forms, which it is hoped will soon be in cultivation:—Anaphalis chlamydophylla, Diels; Cremanthodium Forrestii, J. F. Jeffrey; C. nobile, Franch; C. rhodocephalum, Diels; Pertya phylicoides, J. F. Jeffrey; and Saussurea leucoma, Diels.

CHELTENHAM ROOT, FRUIT AND CHRYSANTHEMUM.

NOVEMBER 13, 14.—The 42nd annual show of the above society was held in the Town Hall, Cheltenham, on these dates, and was in all respects an admirable exhibition. Chrysanthemums were superb. The specimen plants were better than for some years past, and the specimen blooms, though less numerous, were of excellent quality. Primulas, Begonias, Cyclamen, Carnations, Salvias, and Violets were shown to perfection. Fruit all round was of good quality, and the classes well filled.

The most attractive feature of the floral section was undoubtedly the collection of Japanese Chrysanthemums shown in six distinct varieties and staged at the entrance to the hall. Mr. G. J. MAYO was successful in winning for the first time the new cup offered by the Mayor and Corporation, having won a similar cup outright. The varieties shown by Mr MAYO were Swanley Giant, Leon Truelli, Rose Ellis, Chelsonia, Mme. Alberta Bertland, and Splendour. The prizes for three distinct varieties were secured by Lady DICK-CUNYNGHAME (1st), Mrs. ST. CLAIR FORD (2nd), and Mr. G. J. MAYO (3rd). Very handsome groups of Chrysanthemums were shown by Mr. MAYO and Mr. G. W. RESTALL, who were placed 1st and 2nd respectively. In the class for six varieties suitable for house or table decoration, Mr. HUGH ANDREWS, of Toddington Manor, was placed 1st, and Messrs. BARRETT & SONS, 2nd. The 1st prize for a collection of Japanese Chrysanthemums and foliage plants was won by Mr. HUGH ANDREWS; 2nd, Mr. E. ADLARD.

In the classes for cut blooms of Japanese varieties, Mr. HUGH ANDREWS, Mr. E. ADLARD, Mrs. ROBINSON, Mr. W. J. GRESSON, and Messrs. J. BARRETT were the prize-winners.

In the open classes for plants, the principal prize-winners were Mr. W. J. GRESSON, Mr. J. HORLICK, Mr. HUGH ANDREWS (for Carnations); Mr. A. DRAKE, Mr. J. HORLICK, Mrs. RATCLIFFE (for Cyclamens); Mrs. RATCLIFFE, Mr. A. DRAKE, Col. FAIRFAX RHODES (for Begonias); Mr. J. PLAYER, Mr. H. O. LORD, Col. FAIRFAX RHODES (for Salvias); Mr. H. ANDREWS, Col. FAIRFAX RHODES, Mr. C. M. FLETCHER (for Primulas); Mr. H. O. LORD, Mr. H. J. TILLEY, and Mrs. ROBINSON (for Violets).

In the fruit classes the chief awards went to Sir PERCY CUNYNGHAME, Messrs. W. J. GRESSON, W. S. R. COX, J. BOTT, G. W. RESTALL, HENRY NEWMAN, F. TAYLOR, J. PLAYER, W. GORDON CANNING, W. J. SPENCER, J. HITCH & SONS, C. M. FLETCHER, H. O. LORD, H. J. TILLEY, HUGH ANDREWS, Col. FAIRFAX RHODES, Mrs. AUBREY, Mrs. RATCLIFFE and Mrs. H. GRAVES.

LIVERPOOL CHRYSANTHEMUM.

NOVEMBER 13, 14.—The annual autumn exhibition of this association was held in the Corn Exchange. Although the available space has been slightly decreased, the Exchange is yet a desirable place of exhibition, and is well lighted. The show was well up to the average of the 32 that have preceded it, and the room was furnished with bright and effective exhibits.

For 36 blooms, 18 Japanese and 18 Incurveds, in not fewer than 12 varieties in each section, there were three competitors. The 1st prize was won by Sir GILBERT GREENALL, Bart., Warrington (gr. Mr. C. Goves), his best flowers being *(Japanese)* William Turner (which secured the N.C.S. certificate as the best Japanese bloom in the exhibition), F. S. Vallis, Frances Jolliffe, Président Viger, Lady Talbot and Hon. Mrs. Lopes; *(Incurved)* G. F. Evans, Mrs. G. Denyer, Marjorie Shields and Romance. 2nd, Sir W. H. TATE, Bart., Woolton (gr. Mr. G. Haigh). His example of Buttercup secured the N.C.S. certificate offered for the best Incurved bloom in the show.

The 1st prize for 18 Incurved blooms in not fewer than 12 varieties was awarded to THOMAS HENSHAW, Esq., West Derby (gr. Mr. J. George); 2nd, A. COOR, Esq., Aigburth (gr. Mr. C. Osborne).

In the class for 12 blooms, Mrs. CLARKE, Allerton (gr. Mr. J. Clark), was the 1st prize winner.

The best 18 Japanese blooms, in not fewer than 12 varieties, were shown by Mr. C. GOVES.

In the class for 12 blooms, J. STONE, Esq., Roby (gr. Mr. D. McKelvie), was placed in the 1st position.

The class for six vases of singles, nine blooms in each vase, brought a charming display, in which Mr. LOO THOMPSON, an amateur, secured the premier award. This exhibit was a pretty feature of the show.

FRUIT.

In the class for a collection of six dishes, F. BIBBY, Esq., Shrewsbury (gr. Mr. J. Taylor), was the 1st prize winner; 2nd, Mr. H. OSBORNE.

The 1st prize for four bunches of Grapes was won by EDMUND LORD, Esq., Rawtenstall (gr. Mr. J. Wright), with bunches of Black Alicante and Muscat of Alexandria.

Black Alicante was best shown in the separate class by W. H. FERNIE, Esq., Thornton Hough (gr. Mr. W. Piper), whilst for any other black variety, Mr. E. R. FINCH was successful.

For two bunches of Muscat of Alexandria, Mr. W. WILSON excelled.

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to R. LE DOUX, Esq., West Derby (gr. Mr. J. W. Fletcher), for a collection of Cypripediums; Messrs. R. P. KER & SONS, Liverpool, for Cyclamens backed with Crotons and Palms; Messrs. MANSELL & HATCHER, Rawdon, for Orchids; Messrs. FISHLOCK BROS. for cut blooms in great variety; Messrs. STUART LOW & Co. for Orchids and Carnations.

Silver Medals to the LIVERPOOL ORCHID Co. for Orchids; Mr. W. ROWLANDS for Begonias; Mr. C. A. YOUNG for Carnations; Mr. NORMAN DAVIS for Chrysanthemums; and Mr. H. MIDDLEHURST for Potatos.

BLACKBURN CHRYSANTHEMUM.

NOVEMBER 15, 16.—The annual show of this society was held in the Town Hall, Blackburn, on these dates. The exhibits were more numerous than usual, and overflowed into an adjoining room.

In the class for a group of large-flowering Chrysanthemums two exhibits were staged, both being well arranged. Mr. H. BRADBURN was placed 1st; 2nd, T. MITCHELL ECCLES, Esq. (gr. Mr. J. Pimplott). The 1st prize for a group of single Chrysanthemums was awarded to Mr. PIMPLOTT; 2nd, J. THOMPSON, Esq. (gr. Mr. C. Samways).

For a group of miscellaneous plants Mr. H. TINDWALL, secured the chief award. The 2nd and 3rd awards were won by H. SHUTT, Esq. (gr. Mr. J. Bartlett), and Mr. C. SAMWAYS respectively.

The best group of Orchids staged on a table 8 feet by 4 feet, was shown by Col. J. RUTHERFORD, M.P. (gr. Mr. J. Lupton). For a table of Cypripediums, WILLIAM THORN, Esq. (gr. Mr. A. E. Strafford), was successful with a collection of much merit, artistically arranged with light foliage; 2nd, ALFRED NUTTALL, Esq. (gr. Mr. T. Cass).

There were three entries in the class for a table of Begonias, H. SHUTT, Esq., being awarded the 1st prize.

CUT BLOOMS.—In the class for 24 Incurved Chrysanthemums, not fewer than 18 varieties, A. E. TROOP, Esq. (gr. Mr. R. H. Jones), was placed 1st; his best flowers were Buttercup, Romance and W. H. Thorpe; 2nd, Mr. H. BOYD. Messrs. H. BRADBURN, J. W. WELLS, and R. H. JONES were successful in this order for 12 varieties.

For 24 Japanese blooms, in not fewer than 18 varieties, Capt. FIELDEN, Witton (gr. Mr. H. Boyd), won the 1st prize, the leading blooms shown being Countess of Granard, Hon. Mrs. Lopes, White Queen and Mrs. A. T. Miller; 2nd, Mr. H. BRADBURN; for 12 blooms Messrs. BOYD and PIMPLOTT were placed 1st and 2nd respectively, whilst for three vases Mr. JOHN THOMPSON was successful.

FRUIT AND VEGETABLES.—Exhibits in this section were not very extensive. EDMUND LORD, Esq. (gr. Mr. J. Wright), secured three 1st prizes for Grapes, having the best Black Alicante and Muscat of Alexandria.

Mr. J. BARKER was awarded the 1st prize for a collection of vegetables; 2nd, Mr. H. J. WELLS, who secured the 1st prize for six Onions.

BOLTON CHRYSANTHEMUM.

November 15, 16.—This annual show was held in the Albert Hall, Bolton. The entries were fully up to the average, but there was only one exhibit in the group class, compared with three or four on former occasions.

In the class for 24 blooms, 12 Japanese and 12 Incurved varieties, distinct, Sir **Gilbert Greenall**, Bart., Warrington (gr. Mr. C. Goves), added to his list of many successes of this season. His best blooms were *(Japanese)* F. S. Vallis, Mrs. A. T. Miller, W. A. Etherington, W. Turner; (*Incurved*) Mrs. G. Denyer, Romance, E. F. Evans, and Mrs. Hankey. 2nd, Sir W. H. **Tate**, Bart., Woolton (gr. Mr. G. Haigh).

For 36 Japanese blooms in not fewer than 24 varieties Mr. C. **Jones**, Abergele, won the 1st prize.

The class for six vases of single varieties, distinct, brought a good contest. The prize winners were: 1st, Mr. A. **Adshead**; 2nd, Mr. H. **Shone**; and 3rd, Mr. W. P. **Rylands**.

The premier vase of Carnations was staged by Mr. J. **Entwistle**.

Plants.

As stated above, only one exhibit was staged in the class for a circular group of miscellaneous plants arranged for effect 12 feet in diameter. The exhibitor was J. W. **Makant**, Esq. (gr. Mr. H. Shone), and he was awarded the 1st prize.

A group of naturally-grown Chrysanthemums arranged in a half circle 9 feet by 6 feet, shown by **Gerard S. Peck**, Esq., Heaton (gr. Mr. B. Hardy), was placed 1st; 2nd, Miss **Anna M. Philips**, Prestwich (gr. Mr. D. Wilson).

Mr. D. **Williams** was successful in the similar class for a group of large-flowering Chrysanthemums.

For a table of Orchids Mr. G. H. **Drinkwater** was awarded the 1st prize with a very effective display. Cattleya labiata, Cypripediums in variety, and Oncidium varicosum were well staged on a groundwork of Ferns and Palms. 2nd, J. **McCartney**, Esq. (gr. Mr. W. Holmes).

NATIONAL CHRYSANTHEMUM.

ANNUAL CONFERENCE.

November 20.—There was a large attendance at the annual conference of the National Chrysanthemum Society, which was held at 7 p.m. in the Essex Hall, Strand, London, on the above date, when Dr. Russell, of the Rothampstead Experimental Station, delivered a lecture on "Partial Sterilisation of Soil," which was illustrated by lantern slides.

Dr. Russell said that during the past eight years they had been experimenting at Rothampstead with a method of soil treatment known as partial sterilisation, working with a variety of plants, and he had collected the results of those experiments which deal with Chrysanthemums, and proposed to bring them before the notice of the Society. The lecturer explained that by sterilisation was not meant rendering the soil sterile; rather the reverse, for the various methods employed had the result of increasing the fertility of the soil. The soil is densely inhabited by minute living organisms, some helpful to plant life and others harmful, and laboratory experiments led them to conclude that any method of treatment which killed some, but not all, would be beneficial to soil fertility, and it was a fortunate fact that the injurious organisms were the more easily killed, whilst the essential bacteria were hardier and survived treatment which decimated the others. It was patent that any method which would destroy the harmful denizens of the soil without interfering with the necessary inhabitants would give these latter freer scope to exert their beneficent purposes. Their experiments proved that, by partial sterilisation, this result was achieved, and that the treatment had increased the amount of plant food in the soil. The experiments had been chiefly conducted with exhausted soil—soil in which plants such as Chrysanthemums, Cucumbers, and Tomatos had been grown, and which, in its untreated state, was incapable of producing healthy plants. The lantern slides illustrated the great improvement which resulted from several of the forms of treatment. The experiments started with a necessarily limited number of plants, as near alike as possible, and their treatment, as regards watering, feeding, etc., was as identical as possible. The methods of partial sterilisation followed were heating by steam and treating the soil with various poisons. These may be grouped as follows:—

(1) Formaldehyde, pyridene, and calcium sulphide.

(2) Carbolic, cresol, toluol, petrol, and other tar oils, chiefly waste products.

This is the present order of merit, but, as the experiments are only in their infancy, the order given must be looked upon as being entirely provisional, for at any time future experiments may result in deposing the substances in Group 1 in favour of some other agents. Formaldehyde is the agent to be most generally recommended, for it is a vapour, and so easily permeates the soil. Toluol and petrol, like formaldehyde, are vapours, but they are inflammable and dangerous to use. The tar oils are not successful because they are sticky and do not mix well with the soil. Heating by steam has, so far, been found to be the most satisfactory method, but its results are closely followed by the use of Group 1.

Methods of Application.

Partial sterilisation by steam may be performed by making a structure like a shallow plant pit and placing in it about a cartload of the soil. The sterilising apparatus is shaped like a tined harrow, or like a gridiron (see fig. 180); an open end should project so that the steam may enter. A convenient size of the apparatus has been found to be about 3½ feet long by 2½ feet wide, the piping being 1 inch in diameter. Steam is injected at a pressure well above atmospheric pressure, and the soil heated to a temperature of about 200° Fahr. for 20 to 30 minutes. The soil is then removed and placed in a heap, under cover for choice, to cool slowly. The heating of the soil may be done by dry heat, but it is not so easy to control the heat, and if the soil becomes overheated there is a complete killing of its micro-organisms.

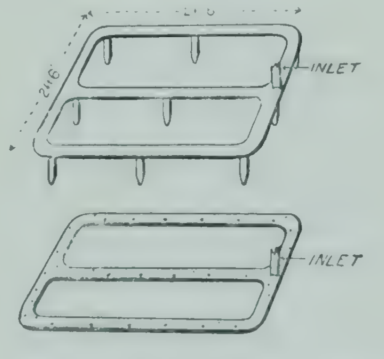

Fig. 180.—The harrow and gridiron methods of sterilising soil.

The poisons may be watered or sprayed on the soil, and the soil be mixed thoroughly. On the Continent, an injector has been used, but not with altogether satisfactory results. The general conclusions regarding the effects of partial sterilisation which may be drawn are that cuttings do not root so readily in the treated as in untreated soil, but this retardation is ultimately made up for, and, once roots have been formed, the plants grow faster and stronger, flower earlier, and produce larger flowers. The root system is also much better, the roots are more abundant, and contain more fibres. The differences between the treated and the untreated soils is not so marked when a very good compost has been used, and the difference can be still further reduced by adding manures. In fact, the treatment takes the place of manure, and plants growing in the treated soil can be grown longer without feeding than is the case with untreated soil. The great advantage of the treatment is that of soil economy, for the same soil may be used over and over again, but, in the case of the private grower who can obtain plenty of manure and good virgin loam, it cannot be said there is any advantage to be obtained from the treating of the soil unless future experiments showed that the flowers proved to be better; nevertheless the methods are of great importance to the commercial grower who has to buy his soil and manure. This is a matter for experiments on a large scale, and it is only by trial and experiment that any progress can be made, and the object of the lecturer was to point out a direction in which experiments may profitably be conducted.

The Discussion.

In reply to Mr. Leach, it was stated that the quantity of chemical required to sufficiently sterilise the soil was 1 part per 1,000. Too much had been used, and, in future experiments, the quantity would be reduced in the endeavour to arrive at the correct minimum. Mr. Leach also asked the average price of formaldehyde, and Dr. Russell replied that it was about 6d. per lb.; the cost would work out at 9d. per ton of soil treated.

Mr. Cull inquired as to the results of adding manures to the treated soil, to which Dr. Russell replied that the use of high manure reduces the effect of the sterilisation.

Mr. Rowbotham asked if sterilisation by frost was as effective as sterilisation by heat, and elicited the reply that experiments in America had shown the results to be the same; but the soil in that country lies frozen for much longer periods than is the case here.

Mr. J. Stevenson quoted his experience with sterilisation of soil, which he had chiefly practised in the hopes of combating the streak disease in Sweet Peas. He used formaldehyde at a strength of 1 gallon to 200 gallons of water, and watered a plot of ground six weeks before planting out the seedling Sweet Peas, and at the end of two months these plants were fully 20 per cent. better than any others, and eventually they became superior to any plants he had ever seen; their growth increased considerably. When sterilising soil by heat for Chrysanthemums the results were not good, but he was of the opinion that he had subjected the soil to too much heat. The plants "hung fire, and never pulled up with the others." At the end of the month the cuttings had not formed roots: the roots ultimately made were too fine in texture, and of a greyish colour. Later, the plants grew too rapidly, but the root-action was always feeble, and towards the end of the season nearly all the foliage was lost.

Mr. A. Cragg said that his firm had been experimenting for the past five years, and they also found that cuttings did not root readily in sterilised soil. It seemed as if they suffered from indigestion—there was too much food available for them; poor, but not diseased, soil is the best for cuttings, and only rooted plants should be potted into sterilised soil. He was convinced of the value of partial sterilisation by steam to the grower who had to purchase his soil, and their experience with Ferns showed that plants in 2½-inch pots were saleable from two to three weeks earlier than those grown in untreated soil.

Mr. E. F. Hawes described a method of treating the soil by steam heat by means of a cylinder and buckets attached to an endless chain.

Mr. Fairlie spoke of an amateur gardener who sterilised soil by using the household sanitary galvanized dustbin. A small quantity of water was placed under an inverted sieve in the bottom of the bin, and the bin then filled with soil. This was heated by a coke fire, and the results were admirable. He had grown 1,000 Carnations in steam-sterilised soil, and the plants grew with almost alarming rapidity.

In a humorous speech, Mr. Wells gave his experience of treating soil to steam heat to prevent "rust," and to destroy the seeds of Chickweed, which were a great pest. Mr. Wells used a 10-ton traction engine, and treated a large quantity of soil with gratifying results. The expense was great, but it paid.

Mr. C. H. Curtis reminded Dr. Russell that on a former occasion he had inquired as to the value of "drying-out" diseased and worn-out soil versus steam-heating, and instanced the methods used by the Tomato growers in the Channel Islands when treating sick soils, and suggested that this drying-out method would be much cheaper than treating it with chemicals. Dr. Russell replied that this method was receiving attention, but at present he was not prepared to make a definite statement, although he was aware of instances in which it had proved effective.

Mr. Bevan, in proposing a vote of thanks to Dr. Russell, spoke of the old method of drying soil for Cucumbers, &c., on the top of boilers to kill eelworms and wireworm; and also said that he had been surprised to see how well the hardy deciduous trees withstood drought when growing on soil which had been burnt to destroy the roots and seeds of noxious weeds.

Mr. D. B. Crane, who seconded the motion, said that cultivators might well expect a great future for the sterilisation of soil: the experiments were in their initial stage, and he confidently looked forward to hearing of cheaper methods of performing the work.

AYR CHRYSANTHEMUM.

NOVEMBER 20.—The Ayr Chrysanthemum Society held its annual show in the Town Hall, Ayr, on this date, when there was an excellent exhibition of plants and blooms of Chrysanthemums and a capital show of other plants, flowers, fruits and vegetables. The entries compared well with those of previous years, and the quality generally was very high. The "Pollock" Cup, offered for Chrysanthemum plants, was won by Mrs. POLLOCK, Glenfairn (gr. Mr. W. Currie); 2nd, W. BAIRD, Esq., Cambusdoon (gr. Mr. R. J. Clark). Mrs. POLLOCK also excelled in the class for two plants not disbudded, for a circular table of plants, and for Chrysanthemums in 7-inch pots. Mr. JAMIE led for singles. In the other pot plant classes, including Primulas and Begonias, the most successful exhibitors were J. A. CAMPBELL, Esq., Craigie House (gr. Mr. Robert Blair); W. BAIRD, Esq.; R. A. OSWALD, Esq., Auchincruive (gr. Mr. A. M'Cartney), and Mrs. POLLOCK. In the classes for cut blooms, Mr. A. S. WATT, Whiting Bay, Arran, was a very successful competitor.

W. BAIRD, Esq., led for four vases of Japanese blooms, not disbudded. In the other classes for cut flowers and decorative work the winners were Mr. A. NOBLE, Corsehill, Ayr; Mrs. POLLOCK; Mr. JAMIE, and Mr. C. L. RENDALL, Alloway. In the fruit classes the finest Grapes were shown by R. A. OSWALD, Esq., and Mr. A. NOBLE. Mr. T. SMITH, Dundonald Road, Kilmarnock, was placed 1st for 12 dessert and 12 baking Apples. R. A. OSWALD, Esq., was 1st for Pears. An amateur, Mr. T. ANDERSON, had the best collection of vegetables in both the open and amateurs' classes.

HULL CHRYSANTHEMUM.

NOVEMBER 20, 21.—Twenty years ago the exhibitions of this society were amongst the most important in the country, but interest waned, and nine years ago the committee decided to discontinue the show. In the meantime a new City Hall has been built in a favourable part of the city, and the old show was resuscitated this year. Unfortunately, the society has, in the interregnum, lost one of its most valued supporters, the late Mr. E. Harland, who so long acted with Mr. Dixon as secretary.

CUT BLOOMS.—The principal of the ten open classes was for 24 Japanese blooms, in not fewer than 18 varieties. The 1st prize, consisting of a silver cup and the sum of £6, was won by H. G. HEWITT, Esq., Weelsby Old Hall, Grimsby (gr. Mr. Fleming), with full-sized, solid, richly-coloured blooms, well staged. The leading varieties were Lady Talbot, Mrs. G. C. Kelly, Mme. P. Radaelli, Mme. G. Rivol, Hon. Mrs. Lopes, Mrs. A. T. Miller, Frances Jolliffe, Fred. Green, W. Mease, Miss A. Nicoll, W. Jinks, and President Viger. Captain J. F. LAYCOCK, Wiseton, Bawtry (gr. Mr. Musk), was a good 2nd, and ARTHUR JAMES, Esq., Coton House, Rugby (gr. Mr. A. Chandler), 3rd. Exhibits of Incurved varieties were few in number. Two competed in the class for 18 blooms, and Mrs. HALL WATT, Bishop Burton Hall, Beverley (gr. Mr. G. Wilson), was placed 1st with medium-sized, neat flowers of C. H. Curtis, Mme. Ferlat, Pantia Ralli, Mrs. G. Denyer, W. Pascoe, Mrs. F. Ashworth, Romance, Buttercup, Fred Palmer, and Mrs. J. Seward. In the class for two vases of seven blooms each of two yellow Japanese varieties, Mr. JAMES excelled with Lady Talbot and F. S. Vallis. In a similar class for white varieties, Mrs. HALL WATT won with the varieties Purity and Mrs. A. T. Miller. ARTHUR JAMES, Esq., followed closely. The best six blooms of any Japanese variety were shown by ARTHUR JAMES, Esq., who showed the variety Frances Jolliffe.

For twelve vases of single Chrysanthemums in not fewer than nine varieties, six competed. Mr. MONTAGUE STATHER, Arlington Nursery, Cottingham, won the premier place with handsome, freely-flowered sprays. The varieties Sylvia Slade and Bessie Pagram were especially good. 2nd, E. KENNETH WILSON, Esq., Little Tranby, Beverley (gr. Mr. W. Allison).

For six vases of singles, disbudded, H. HILDYARD, Esq., Cottingham (gr. Mr. A. Drewery), won the 1st prize with such varieties as H. J. Williams, Florrie King, Robert Thorpe, Bessie, and Bronze Pagram.

The local classes were well filled. For 18 Japanese varieties, Miss BENNETT, Westlands, Grimsby (gr. Mr. G. Burrows), won the 1st prize, as she did also for a dozen specimens.

GROUP CLASSES.—In the class for a group of Chrysanthemums and foliage plants arranged for effect four competed. Mr. R. B. WITTY, superintendent of the public parks and gardens of Hull, was placed 1st, with a superior display, but as he elected not to take the prize he was awarded the large silver medal of the North of England Horticultural Society. The next group in order of merit was that shown by Mrs. WHITTAKER, who was awarded the silver cup.

FLORAL DECORATIONS.—A large room was devoted to table decorations and other floral arrangements. Mrs. E. ROBSON, Tower Grange, Hull, was placed 1st for a dinner table decorated with Chrysanthemums.

The exhibits of fruit and veegtables were of a large and varied character.

NON-COMPETITIVE EXHIBITS.—The awards were made to these exhibits by the North of England Horticultural Society. Messrs. CLIBRANS, Altrincham, showed exceedingly fine vegetables, for which a Gold Medal was awarded. Messrs. TOOGOOD & SONS, Southampton, had a similar but smaller display (large Silver-gilt Medal). Messrs. E. P. DIXON & SONS, Hull, showed floral designs, flowers, and fruit (large Silver Medal). Messrs. W. WELLS & Co., Merstham, Surrey, showed Chrysanthemums, for which a Silver Medal was awarded. Messrs. MANSELL & HATCHER, Leeds, arranged an interesting group of Orchids (Silver Medal).

THE LATE HENRY PURSER.

ABERDEEN HORTICULTURAL.

The annual meeting of the members of this society was held recently in the Music Hall Buildings, Aberdeen. There was a large attendance, and the chair was occupied by Colonel Gill, chairman of the society.

The annual report stated that from a horticultural point of view, considering the rather unsatisfactory season, the August show, both in number and quality of exhibits, was creditable to all concerned, while the financial results were also satisfactory. The income for the year amounted to £488 11s. 6d., and the expenditure was £438 1s. 3d., leaving a surplus of £50 10s. 3d., which, with the credit balance of £27 7s. 10d. at the beginning of the season, left a balance of £77 18s. 1d. to be carried forward to next year.

The report was adopted. On the motion of Mr. Todd, seconded by Mr. Robson, it was agreed to start a reserve fund with a sum of £30.

Obituary.

HENRY PURSER.—We regret to record the death, on the 17th inst., at the advanced age of 82, of Mr. Henry Purser, formerly head gardener to Lord Zouche. Mr. Purser commenced his gardening career in the Earl of Denbigh's garden, Newnham Paddocks, Leicestershire. Later he was appointed gardener to the Hon. Wentworth Powis, at Berwick Hall, near Shrewsbury, where he remained for 30 years. He left Berwick Hall to take charge of Lord Zouche's garden at Baronhill, near Rugby, Staffordshire. At the end of five years Baronhill was let and Mr. Purser was appointed to the charge of Lord Zouche's garden at Parham Park, Sussex, where he remained for 13 years. Ten years ago he retired in consequence of failing health, and was granted a pension by Lord Zouche. Deceased's widow is sister to Mr. Owen Thomas.

REV. DR. LANDSBOROUGH.—We learn with regret of the death, on November 22, of the Rev. Dr. David Landsborough, Kilmarnock, at the age of 86. Dr. Landsborough contributed a number of papers to the Botanical Society of Edinburgh. He made a special study of the botany of Ayrshire, and the island of Arran, and he contributed articles on "The Effects of Winter on Vegetation in Arran."

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending November 23, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather.*—As a whole the conditions were dull and unsettled. Rain fell in slight or moderate quantities daily at many stations in the west and north, and on several days in most other parts of the Kingdom. Some localities in the east and south of Britain remained dry, however, throughout the greater part of the week, and at Donaghadee rain fell on only one day.

The *temperature* was above the average very generally, the greatest excess being a little over 4·5° in Ireland, and the smallest 1·5° in England S.E. The highest of the maxima, which occurred late in the period, ranged from 60° in Ireland S. to 56° in several districts, and to 55° in Scotland E. The lowest of the minima were registered during the first half of the week, and ranged from 22° in Scotland E. to 36° in Ireland S., and to 42° in the English Channel. As a rule the minima were some degrees above the normal. The lowest grass readings reported were 17° at Newton Rigg, 18° at Crathes, 19° at Balmoral, and 20° at Hampstead. The temperature of the soil continued below the average in most parts of the country at a depth of 4 feet, but, except at Clacton-on-Sea, it was above it at a depth of 1 foot.

The *rainfall* exceeded the average in Scotland N., but was less elsewhere. At Glencarron there was a fall of 1·07 inch on the 19th. At various places in the northeast, and at a few in the south-west, as well as at Donaghadee, the total fall was less than 0·1 inch.

The *bright sunshine* was below the normal except in Scotland N. and E. In Scotland E. the percentage of the possible duration was 31 and the daily mean 2·4 hours. In Ireland, and the south-west, east, and Midland Counties of England the daily mean was less than an hour. In England E. (where the possible duration was only 8) the daily mean was no more than 0·7 hour.

THE WEATHER IN WEST HERTS.

Week ending November 27.

A warm and wet week—The day temperatures during the week were all above the average, and on the warmest day the highest reading in the thermometer screen rose to 56°, which is 9° higher than is seasonable. The nights were also equally warm for the time of year, with the exception of the last night, when the exposed thermometer registered 4° of frost. The ground is now at about a seasonable temperature both at 1 and 2 feet deep. Rain fell on four days, and to the total depth of rather more than an inch, making this the wettest week for four weeks. Some hail fell at times with the rain on the last two days. About half-past five on the afternoon of the 26th rain and hail fell for ten minutes at the mean rate of over 1 inch an hour. During the week 4½ gallons of rainwater came through the bare soil percolation gauge, and 8½ gallons through that on which short grass is growing. The sun shone on an average for 1 hour 24 minutes a day, which is a quarter of an hour a day short of the average duration for the same period in November. On the only two sunny days the sun shone respectively for nearly four hours, and for nearly six hours, the remaining five days being altogether sunless. The first day and also the last three days of the week were windy, and in the windiest hour the mean velocity was 18 miles — direction S. There was again a seasonable amount of moisture in the air at 3 p.m. *E. M., Berkhamsted, November 27, 1912.*

TRADE NOTICE.

MR. WILLIAM MALLETT, for several years with Messrs. Hobbies Ltd., has joined his brother Mr. George Mallet, of the Cheddar Nurseries, Somerset, as manager of the hard wooded section of that business at the Bridge Hill, Batscombe and Broadway branches, all in Cheddar.

MARKETS.

COVENT GARDEN, November 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

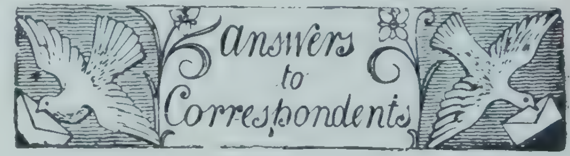
Remarks.—The principal varieties of English Apples available are Dumelow's Seedling (Wellington), Newton Wonder, Bramley's Seedling, Blenheim Pippin, Cox's Orange Pippin, and Allington Pippin. Apples imported, both in boxes and barrels, are arriving in large quantities, the principal varieties being Cox's Orange Pippin (in boxes of 10 to 12 dozen, very handsome fruits), Jonathan, Winter Banana, Grimes' Golden and Spitzbergen. Pears from home growers and the Channel Islands are principally of the Doyenné du Comice variety. Several thousand boxes of Pears arrived this week from overseas, consisting largely of Doyenné du Comice and Winter Nelis, all the fruits being in excellent condition. English hothouse Grapes continue a very heavy supply, the bulk consisting of Black Alicante and Gros Colman, of which some firms are receiving over a thousand packages per day, each of an average weight of 10 lbs. Best samples of Canon Hall Muscat are scarce and in demand. The following tropical fruits are obtainable:—Avocado Pears, Persimmons, Passion Fruits, Custard Apples, Mangoes, Pines, Monstera deliciosa, Lychees and claret-coloured Bananas. Californian Seedless Oranges are obtainable. Cob-nuts remain a good supply. Supplies of English Tomatos are nearly exhausted, but Teneriffe Tomatos are plentiful, the fruits being of good quality. Forced vegetables obtainable include Mushrooms, Dwarf Beans, Peas, Seakale, Potatos, Asparagus and Cucumbers. Holly and Mistleto are making their appearance in the market. Ordinary vegetables continue a very heavy supply. *E.H.R., Covent Garden, November 27, 1912.*

Potatos.

	per cwt. s.d. s.d.		per bag. s.d. s.d.
Bedfords	4 0- 4 6	Dutch	2 9- 3 6
Kents	4 0- 5 0	Belgian	3 0- 3 9
Blacklands	3 6- 3 9	German	3 6- 4 3
Lincolns	3 6- 5 0	Dunbars	6 0- 6 6
King Edward	4 0- 4 9	Scotch (grey soil)	4 0- 4 9

Remarks.—Trade is about the same as last week, and prices are not altered. Best tubers are in good demand. Consignments of foreign Potatos are still large. *Edward J. Newborn, Covent Garden and St. Pancras, November 27, 1912.*



Abnormal Berry of Black Alicante Grape: *T. M.* The very large berry of Black Alicante Grape is interesting, but not remarkable. Its large size is due to abnormal development.

Addresses: *W. F. S., South Hackney.* London Playing Fields Society, 49 and 50, Parliament Street, S.W.; Middlesex County Council, Guildhall, Broad Sanctuary, Westminster.

Apple James Grieve: *H. W.* This variety was raised by Messrs. Dickson, of Edinburgh, Cox's Orange Pippin being one of the parents. It received an Award of Merit from the Fruit and Vegetable Committee of the Royal Horticultural Society on October 12, 1897, when exhibited by Messrs. Geo. Bunyard & Co.

Books: *T. D. Skinner. Chemistry of The Garden*, by Herbert H. Cousins, price 1s. 1½d.; *The Book of Garden Pests and Plant Diseases*, by R. Hooper Pearson, price 2s. 10d. Both obtainable from our Publishing Department. The prices include postage.

Cattleya Leaves: *Bristow.* The leaves are burrowed extensively by the larvæ of a small beetle, and, so far as we can gather, it is a new pest, but, unfortunately, in the absence of adult specimens we cannot give you more definite particulars. If, however, you will be good enough to send us examples of the adult beetles, which will, in all probability, be found on the outsides of the leaves at night, we will endeavour to identify the pest.

Conifer Unhealthy: *Craigs.* There is no trace of disease on the specimen sent. The generally unhealthy state of the tree is probably due to a bad rooting medium, such as cold gravel or clay. An excess of moisture at the roots would also cause the foliage to turn brown and die.

Early-flowering Chrysanthemums: *A. S. T., Edinburgh.* It is not usual for early varieties of Chrysanthemums to flower later or become taller in growth as they get older. Owing to the unusual weather many plants attained to an unnatural height during the past season. The term "disbudding" is applied to the system of removing all but one flower-bud on each shoot. Early-flowering varieties are usually planted in the ground and allowed to grow naturally, the first bud appearing when the plant is from 1 to 2 feet high. After the appearance of this first bud, the plant makes a number of side growths and a quantity of flower-buds; if only one bud is retained on each shoot the flowering should be earlier, not later, as you suggest. It is not advisable to pinch outdoor Chrysanthemums to make them bushy; as a rule, they are naturally quite bushy enough, and pinching produces a soft, attenuated growth which results in much poorer flowers.

Gardener's Illness and Dismissal : *Justice.* (1) Your relative is still legally employed. (2) He should claim full wages during the time he was absent, as his employment was not terminated. (3) He is entitled to a month's notice, or wages in lieu of notice, and the value of the accommodation at the lodge should be included in estimating the amount payable. (4) If the employer can prove that the notice duly reached your relative, this would probably be held sufficient. Your relative had better return to work without delay on leaving hospital, assuming that his health permits.

"Handbook on Pruning Roses" : *Enquirer.* Two editions of the *Handbook on Pruning Roses* have been issued by the National Rose Society since that of 1905—one in February, 1909, and the other in November, 1911. The 1905 edition is therefore somewhat out of date.

Loam for Melons : *J. T.* Liquid manure from the farmyard poured over the heap would be beneficial, but it would be better to enrich the soil with manure as advised in the calendarial on the Management of the Kitchen Garden (see page 408).

Melon in a Collection of Fruit : *C. E. M.* A Melon in a collection of miscellaneous fruits has a point value of eight, compared with six for Pears and six for Apples. The fruit you submitted for our inspection was remarkably good; it was of excellent shape, a rich yellow colour, and splendid flavour. It would certainly be entitled to higher pointing than either of the other fruits you mention.

Names of Plants : *J. Newens.* 1, Cephalotaxus Fortunei; 2, C. pedunculata; 3, Juniperus chinensis; 4, Cryptomeria japonica var. elegans. *J. L. W.* Salvia Horminum.—*A. P. U.* We do not recognise the variety of Chrysanthemum. Send to some grower of these flowers who has means of comparing it with flowers in his collection.—*E. P. & Co.* The berries are those of Schinus Molle. known as the Californian Pepper Tree and Peruvian Mastic Tree. It is not a hardy tree in Great Britain, but is used to a large extent as shade trees and for planting in streets in Australia, California, and other warm, temperate countries.—*Foreman.* 1, Selaginell denticulata; 2, S. uncinata; 3, S. Wildenovii; 4, S. stolonifera; 5, Pteris geraniifolia; 6, Adiantum formosum.

Odontoglossum Leaves Curled : *R., Bradford.* "Curled and sometimes crinkled" leaves such as you describe are often seen on individual plants of Odontoglossum, even where the majority of the plants are not affected. Such leaves are usually smaller than the perfect ones, and indicate that at some period there has been a temporary deficiency in the supply of nutriment, or that the leaf has not had space to develop. Where occasional plants are potted in a compost which does not admit of free drainage, and hence holds too much moisture, the roots become affected, and nutrition is arrested. Again, leaves which have been infested with aphides or thrips when in the tender stage often show such deformity as you describe when they mature. The fact that only occasional plants are affected in your case, whilst the others remain perfect, seems to indicate that the cause is not a serious one, and if you examine the damaged plants by the light of our suggestions you should be able to arrive at a probable explanation. When the Odontoglossum house is kept too warm at night, the leaves become thinner than desirable, and often curl back at the edges; but if that were the cause in the present case the damage would be more general.

Onions, Leeks, and Celery for Exhibition : *C. M.* The ground for Onions should be trenched thoroughly to a depth of at least $2\frac{1}{2}$ feet, and incorporated with plenty of good farmyard manure. The surface should be left as rough as possible, strewn with fresh soot and wood ashes and allowed to remain undisturbed until the time for planting. The seed should be sown from the end of December to the end of the following month in shallow boxes filled with well-prepared soil. The seedlings should be raised in gentle heat, and pricked off when they are large enough to handle. They should be hardened thoroughly and planted out in prepared ground in April at a good distance apart. Liberal supplies of water and liquid manure should be afforded the roots; concentrated fertilisers may be used if liquid manure is not available, and these should be applied during showery weather. Endeavour to keep the plants healthy and growing freely from the moment they appear above the surface until the swelling of the bulbs is completed, when they should be immediately lifted and harvested, taking care not to bruise or damage them. Leeks should be sown and raised precisely in the same manner as Onions, and the seedlings planted out in well-prepared trenches, with a layer at least 18 inches deep of good manure in the bottom of the trench. The plants should be put out in May, and the blanching commenced at once. This is best done by paper collars, which can be purchased from the sundriesman or seedsman. These should be drawn up the stems from time to time until these latter are blanched sufficiently, placing fine soil about the plants as the work proceeds. Afford liquid manure from the farmyard liberally, and damp the tops of the plants during the early evening on fine days during the summer. Celery should not be sown before the end of February or the beginning of March in a compost which is not too rich. Raise the plants in gentle heat, and never allow the seedlings to become dry at the roots. Transplant them in boxes immediately the second leaf is discernible. Grow the plants in a greenhouse temperature, and plant them in liberally-manured and well-prepared trenches as soon as they are large enough and hardened thoroughly. It is hardly possible to over-water Celery during the summer; drought is the most common cause of failure. Celery for exhibition should always be blanched with brown paper, using bands 6 inches in depth, and adding additional strips until the blanching is completed. Liquid manure from farmyard dung and sewage are both excellent stimulants for Celery. Soot also is valuable both for the manure it contains and its effectiveness in preventing attacks of the Celery fly and slugs.

Russian Melon : *H. C.* We are unable to identify the variety from the portion of fruit sent. There are several Russian Melons, and it most nearly resembles the early Russian Water Melon. It is apparently much inferior to varieties usually grown in hothouses, and as you find the flesh unpalatable, you will do well to discard it and stick to the ordinary kinds. The fruits you have would probably make excellent preserve, or they might be candied.

Spraying for Big-bud in Black Currants : *F. W. W.* Mr. A. H. Pearson, Lowdham, recommends spraying with soft soap and Quassia for the destruction of big-bud mite. In a note on the subject in *Gardeners' Chronicle*, February 17, 1912, p. 107, he offers to send full particulars to anyone who wishes to adopt his method. Experiments in spraying were conducted by officers of the Board of Agriculture at Harvington, Worcester, and the lime and sulphur mixture gave the best results. The materials used were lime and sulphur in dry form, one part lime (air-slaked) to four of sulphur.

Substitutes for Animal Manures : *H. M.* As you are unable to obtain farmyard or other animal manures, you will have to rely mainly on concentrated fertilisers. Your soil being sandy and of a hungry nature, you should incorporate with it materials that will help to retain the manurial properties of the fertilisers and improve the texture of the staple. There is nothing better for the purpose than decayed vegetable matter. All fallen tree leaves should be gathered, placed in heaps to decay, and dug into the ground the following autumn. If woods exist in your neighbourhood, it should be possible to obtain a cheap and valuable supply of humus from the deposit beneath the trees and in hollows. Farmyard dung makes the soil darker, warmer, and more retentive of moisture; promotes aeration, and tends to the multiplication of micro-organisms, which play so important a part in the fertility of the soil. The chemical fertilisers should be applied in small quantities in the spring and early summer, when the plants are growing actively. Nitrogen, phosphoric acid, and potash are the principal manures you should purchase.

The Sweet Chestnut : *F. B., Northampton.* The dimensions of several fine examples of the Sweet Chestnut (Castanea sativa) are given in Vol. iv of *Trees of Great Britain and Ireland*, and most of the following information is taken from this work. The age of a tree cannot be determined by its size, since it will grow much more rapidly in certain soil and climatic conditions than others. Trees have been known to attain to a height of 65 feet, with a girth of 3 feet, in less than 40 years; and one well-known example in Ireland, which is probably the largest in the country, is known to be less than 200 years old. This specimen (at Rossanagh, in Wicklow) was planted in 1718. In 1903 it was 80 feet high, with a short trunk dividing into three very large limbs. Near the ground the trunk girth was 49 feet; at 3 feet from the ground the girth was $27\frac{1}{2}$ feet, swelling again at 5 feet to $29\frac{1}{2}$ feet round. The spread of the head was 100 feet in diameter, and the limbs measured in girth 12 feet 8 inches, 11 feet 2 inches, and 10 feet respectively. One of the best-proportioned trees in England is growing near Studley Royal. In 1904 it measured 112 feet in height, and the girth at 5 feet from the ground was 20 feet. A tree at Shrubland Park, Ipswich, is recorded as being 47 feet in circumference near the ground, 31 feet at 3 feet above the ground, and 27 feet at double this height. At Rydal Hall, Westmorland, there is a tree with a girth of $26\frac{1}{2}$ feet at 5 feet above the ground, and 37 feet at the base. The largest tree at Kew has a girth of 21 feet; and one at Stevenston, in North Devon, is said to be 86 feet high, and, although the girth is only 16 feet 11 inches, it is reported to contain 833 cubic feet of timber. Most of the dimensions here given, however, compare unfavourably with those of other famous trees. Possibly the tree at Tortworth is one of the most interesting. It is said to have been planted during the reign of King John, though there does not seem to be any reliable evidence to this effect. It is now nothing but a decayed shell; but it was mentioned by Strutt in 1766 as having a girth of 50 feet at 5 feet from the ground. At 10 feet high it divided into three limbs, the largest of which had a girth of $28\frac{1}{2}$ feet. The remains of this tree are still to be seen; it is on Lord Ducie's estate at Tortworth, in Gloucestershire. On Lord Darnley's estate, Cobham Hall, Kent, there are some trees of a large size, one of which is said to have attained a girth of 33 feet at 12 feet from the ground. The tree also grows to a very large size in Scotland; one, at Castle Leod, Ross-shire, is reported to be 76 feet high, with a girth of 28 feet at the base, and 21 feet 4 inches at 5 feet from the ground. At Inverary Castle, Elwes measured one which was 77 feet high, with a 20-foot girth. The date of the introduction of the Sweet Chestnut to this country is not definitely known. Many authorities are of opinion that it was introduced by the Romans, but others incline to the belief that it is of British origin. The trees you refer to are probably two to three hundred years old.

Vine Border : *Glen.* Not only is it possible to grow Muscat Grapes well for a number of years in a border 6 feet wide, but, in our opinion, they can be grown better with their roots thus restricted than is possible in borders of greater width. When the roots are allowed to ramble unchecked in a rich medium, the shoots often do not ripen properly. Two-and-a-half feet is ample depth for a vine border, and if it is made so that it settles to 3 inches lower than this, so as to allow for slight top-dressings from time to time when the surface becomes matted with roots, it will be an advantage. Boundary walls, with mortar joints and soil on both sides, should be faced with cement half-an-inch thick, and means should be taken to prevent the roots getting under the foundations. If the young vines grow vigorously, it is a good plan to cut a trench 3 or 4 feet from their stems through the border, in the autumn after the first season's growth, when the leaves commence to lose their green colour, so as to check the few roots that may be unduly rampant.

DESTRUCTIVE INSECTS AND PESTS.

III.—AMERICAN GOOSEBERRY-MILDEW.*

(See Coloured Supplement.)

The disease of Gooseberries to which the name Sphærotheca mors-uvæ, Berkeley and Curtis, has been given, is, as its common name implies, of American origin. In the United States it has long been a great trouble to Gooseberry growers, but appears to have been unknown in Europe until about 12 years ago, when the presence of the disease was discovered in Ireland. Since that time the pest has become distributed in most European countries—Norway, Sweden, Denmark, Germany, Finland, Russia, Belgium, and Holland—and has been rampant in a number of English counties for the past six years. It has done so much damage, and is so feared by growers, that, as already stated (September 28), it was scheduled under the Destructive Insects and Pests Acts, 1877 and 1907, as a disease the presence of which must be at once notified to the Board of Agriculture and Fisheries, the Clerk to the Local Authority, or to an Inspector of either of these bodies. The notification of the disease applies also to its occurrence on Currant bushes, which may also be attacked. The sale of diseased Gooseberries is prohibited by an Order dated March 30, 1912. Legislation has been introduced to deal with Gooseberry-mildew in Norway, Sweden, Finland, Holland, and Denmark.

The first appearance of the American Gooseberry-mildew in the British Isles was recorded and illustrated in the *Gardeners' Chronicle*, August 25, 1900, p. 143, where an excellent account of the life history of the disease is given.

It is only too true that the American Gooseberry-mildew is a serious pest which causes immense loss, but the fact deserves to be emphasised. The mildew (see coloured supplement) attacks leaves, shoots and fruits; and badly-attacked fruit is ruined for market purposes, even if the sale of diseased fruit were not forbidden. In a leaflet issued by the Board of Agriculture it is stated that the disease has "greatly increased the cost of cultivation of Gooseberries in the countries in which it has appeared, and in some cases it has rendered Gooseberry-growing impossible."

There are two readily distinguishable stages of the disease—the so-called "summer" and "winter" stages. The first of these may appear from May (or even April occasionally) throughout the summer until about November, and is in the form of a soft, white mildew on the leaves of new wood and on the fruit, but not commonly on leaves of old wood (coloured plate figs. 1-4). This form produces great numbers of minute spores, which serve to distribute the pest, as they are blown by the wind and carried about in other ways, and on falling on young fruits or opening buds germinate quickly. In moist, warm weather the mildew may in this manner spread with great rapidity, though it does not always do so. The "summer" spores are very numerous, but short-lived, and when the weather is dry and cool they may not be seriously harmful.

The so-called "winter" stage (coloured plate, figs. 5-7) may be found from July onwards, throughout the winter until the succeeding spring. It occurs in the form of dull-brown patches of a colour which has led to the term "chocolate stage" being employed. Towards and during winter the colour changes gradually until it is soft grey. If these chocolate or grey patches are examined with a pocket-lens little black dots may be seen. These are the winter fruits, or perithecia.

In the "summer" stage a felty mat of mycelium is produced—the white stage—and from this spring chains of conidia or "summer" spores referred to above (fig. 1 of coloured plate). In the "winter" stage the black fruits or perithecia each consists of a strong, hard case or shell, containing eight resting spores, which are liberated in spring and early summer (May to July) to continue the life-history of the species, or as is the case with some to remain dormant for a time. "Some winter fruits remain attached to the infected twigs throughout the winter, but the greater number fall off and lie in the soil. Most of them burst and release the infectious spores in the following summer, but there is reason to believe that they may lie dormant for about 18 months, and infect the bushes in the second year."†

American Gooseberry-mildew has doubtless been distributed in many ways, not the least of these being connected with the trade in Gooseberry cuttings and bushes from infected centres. In this way diseased stocks have been transported over railways and waterways, as well as by road, and may unwittingly be carried by a visitor from a diseased plantation to his own. Diseased berries may serve to spread infection, as also may baskets in which such Gooseberries have been transported. The wind, animals, birds, and even insects, may also act as distributors of spores.

Soft, young, rapidly-growing shoots, especially those from bushes growing on well-treated, highly-manured, deep, porous land, are the most readily attacked, and some varieties which are naturally exceptionally vigorous growers, and produce much young wood late in the year, are more liable to attack than slow-growing sorts. According to the Board of Agriculture, the Keepsake, White Lion, and Crown Bob varieties contract disease to a greater extent than the slow growers—Whitesmith, Careless, and Long Swan. So far as berries are concerned the soft-skinned berries of Golden Drop and Whinham's Industry are more apt to suffer from mildew than those of any other variety. "Ripe berries of any variety are liable to attack. In the case of Keepsake, the berries are fairly immune, while hairy berries of all varieties appear to suffer much more than smooth ones."

In considering preventive and remedial measures, it should always be recollected that a pest should be attacked at the most vulnerable stage of its life-history. In the case of American Gooseberry-mildew, this period appears to be immediately before the date when the perithecia fall off the bushes on to the soil, for they are the means by which the disease is carried on from year to year. The most direct and satisfactory means of combating the mildew, therefore, is to remove all affected shoots early in October, before the perithecia have fallen and infected the soil. All prunings should be burnt. In this way most of the perithecia are destroyed. Such pruning at the proper time is, perhaps, worth all other measures put together, though other steps should be taken when occasion demands. Among these are:—(1) Care in purchasing young bushes; (2) pruning before planting; (3) care not to plant in infected soil; (4) thorough disinfection of packages in which diseased bushes or berries have been placed, using a solution of 1 lb. of copper sulphate in 20 gallons of water; (5) careful and regular inspection of the bushes to ensure early detection of an outbreak; (6) spraying in spring and summer with liver of sulphur, 1 lb. in 32 gallons of water, or 1 lb. in 24 gallons after July, with the addition of 1 to 1½ lb. of soft soap; (7) nitrogenous manures should be used sparingly; and (8) the prompt gathering and destruction of all diseased berries.

One of the chief things to be considered by both private and market growers is the fact that the disease or its suspected presence must be reported, and to this end they should be on the look out for the appearance of the mildew, and should submit specimens suspected of the disease to the nearest authority. *H. C. Long.*

THE WOBURN FORESTS.

It would be excusable if, after reading what has been written about forestry and the need of it in this country, the conclusion was arrived at that there were no good examples of forests to be found in the British Islands. The illustrations in forestry books are, as a rule, prepared from photographs taken in other countries, those of British woods being generally to show how things should not be done. Yet there are well-managed woods here equal to any to be found on the Continent, although they are, sad to say, comparatively few and far between. Woburn, the estate of the Duke of Bedford, has forests probably second to none in the kingdom.

On a recent visit to these woods, in company with Dr. Henry and the students of forestry from Cambridge, I had an opportunity of seeing British sylviculture at its best.

Little more than 100 years ago the land now occupied by trees was a barren, sandy waste, and there were doubtless plenty of people then who thought it worthless for tree-growing, just as there are people now who would have us believe that our millions of acres of waste land can never be made productive. Such people ought to be taken to Woburn Sands, and they would then cease to talk about the impossibility of converting "waste" land into profit-yielding forests.

At Woburn about 5,000 acres are covered with Scots Pine, which is particularly happy in the deep sand of the higher elevations. Some writers tell us that Pine woods cannot be naturally regenerated, but there is no difficulty at Woburn. Indeed, it appears unnecessary ever to resort to artificial regeneration except in the formation of new woods, which, in the strict sense of the term, cannot be called regeneration. A mature Pine wood of about 12 acres in area which had been clear felled in two roughly equal parts, with an interval of three years between the cuts, is now thickly covered with remarkably sturdy young trees from 12 to 15 years old. This is interesting, because it is exceptional, as some of the seeds must have been wind-carried well over 100 yards, no seed trees having been left standing. Beyond the erection of wire-netting to keep out the rabbits, nothing was done to help the seedlings, except, of course, that the ground was cleared of heather at the time of felling. Plantations of all ages look remarkably healthy, and are as well stocked as though machine-sown.

The woods of mature Scots Pine are perhaps rather thin, although they are denser than is usually the case in this country. It was interesting to see a number of clean-stemmed maritime Pines, fully as high as the Scots, and quite as straight in the shaft. The Weymouth Pine suffers here, as in all parts of the country, from the fungous disease Cronartium ribicolum, which prohibits its use as a forest tree in this country, and has lately commenced to be destructive in the United States.

The Larches at Woburn are perfect, and, in consequence, extensive plantings are being made. The Japanese Larch still has its staunch supporters, though they received a shock from its behaviour in the drought of 1911. Up to about 80 years of age in the hollows and 60 years on the sandy hillsides of Woburn, the European species produces very good crops of excellent timber, but it is advisable to cut it at the ages mentioned, otherwise it gets "pumped," that is, it begins to deteriorate at the base of the stem. This is no doubt due to the comparative poorness of the subsoil. Disease is present, but the vigorous growth of the trees enables them to recover from its attacks. Experiments are being conducted by Mr. E. R. Burdon, of the Cambridge Forestry School, with a small plantation of eight-year-old Larches in an unfavourable soil, the object being to artificially infect the trees by placing badly-cankered sticks under them. Although this has been going on for some years now, none of the trees show signs of infection. The general behaviour of the Larches at Woburn confirms the growing belief that the Japanese Larch is in no way superior to the European, and is in fact inferior to it in more ways than one.

It is a pity that Corsican Pine does not produce better timber at an early age. In mining districts the thinnings are eagerly bought for conversion into pit-props, as the young stems, although not very durable, are generally exceptionally clean, and practically free from taper. But there are no mines anywhere near Woburn, so that this tree has no special value here. The so-called "Mermaid" wood, composed of European Larch and Corsican Pine in the proportion of about 2 to 1, was planted in 1900, so that, allowing three years as the age of the seedlings when put in, the trees are now 15 years old. The Larches are, on the whole, better than the Corsicans, but there is no danger of the latter being suppressed. The Larches are from 25 to 40 feet high, and the Corsicans from 20 to 30 feet. The average girth works out at about 11 inches for both species. An interesting experiment has been carried out in an exposed position on a hill-top, Corsican and Scots Pine having been planted pure in two plantations standing side by side. Both show remarkable vigour, and there is little to choose between them as regards height and girth. These plantations are about 12 years old, and although it is as yet early to judge, the Scots Pine should ultimately be the more valuable on account of its superior timber.

Broad-leaved trees are not a great feature in the Woburn woods, and this is not surprising considering the character of the soil. Oaks in pure plantations were planted 11 years ago on the German method, viz., in rows 4 feet apart, the distance between the plants being 18 inches, so that the number of plants per acre works out at something like 7,000. These plantations were laid down according to the directions of Sir W. Schlich, and although they will probably need underplanting before they reach maturity, no fault, beyond perhaps the excessive cost of planting, can be found with them at present. Needless to say, Quercus sessiliflora has been chosen for this experiment, as the soil is altogether too dry and light for the pedunculate species. Chestnuts, although apparently vigorous and healthy, almost invariably develop ring shake, their timber thus being rendered useless for anything but fence posts and other rough work. This mysterious defect has baffled foresters and scientists alike, but it is significant that the main fissures in several felled trees which we examined all nearly exactly corresponded, viz., were situated in the 50th annular ring from the date of felling (1911). Weather records show a winter of extreme severity in the years 1860-61. In regions not subject to hard frosts ring shake is comparatively seldom found, so it is possible that frost may be the cause of the trouble. Ash grows well in some of the more fertile spots at Woburn, and some remarkably fine specimens are to be seen, but extensive plantings will never be possible over the large areas owing to the lack of mineral foods, particularly lime, in the soil.

I do not believe there are forests to be found in this country better than those just described, and it would be interesting to compare some of the yields with those from Continental woods. The work at Woburn is on the lines of true forestry, not the casual arboriculture which is common on so many British estates. Some things there, such as the non-removal of mature timber or the excessive number of shelter trees over newly-formed plantations, would surprise Continental foresters, but it must be remembered that the Duke of Bedford, although keenly interested in forestry, has also a love for the effects produced by large groups of trees, and prefers a fine view to the profits which could only be made by spoiling it. Mr. Mitchell, his forester, understands this too, and the result is not only good forestry but a landscape of exceptional beauty. *J. G. Watson.*

SOUTH AFRICA.

VALUE OF SMALL HOLDINGS.

It is interesting to find that the small holdings movement is penetrating into such sparsely-populated regions as South Africa, and it might seem paradoxical that a country with a population of 12 persons to the square mile should concern itself with the problem of small holdings. But to the observant student of intensive cultivation, no paradox is involved, for the question of small holdings is at bottom the question of the limits of size consistent with the most efficient cultivation.

As the writer of the article points out, Mr. Seebohm Rowntree, in his recent work on *Land and Labour; Lessons from Belgium*, concludes, from a careful investigation extending over four years, that Belgium gains enormously from the subdivision of her land among large numbers of small cultivators. The facts are eloquent. With a naturally poor soil, Belgian crops—other than Wheat—stand first in Europe for amount of yield per acre, and the average yield of Wheat reaches the fine quantity of 34 bushels per acre. Side by side with this high productiveness stands the fact that the density of population of Belgium is not far short of double that of England, the respective numbers being 589 persons per square mile in Belgium, and 342 in Great Britain. Applying the moral to be drawn from Europe to the case of South Africa, the *South African Agricultural Journal* recognises that small farming is to be encouraged, and maintains that, with the small holdings, there must be freehold and co-operation. It urges that every farmer should lay off an acre-farm, which should serve him as a model and a standard to which he might aspire to raise the yields from his larger fields.

NEW OR NOTEWORTHY PLANTS.

BUXUS HENRYI, MAYR.

MAYR, in his *Fremland Wald und Park bäume*, p. 451 (1906), refers to a peculiarly distinct species of Box, discovered by the eminent Chinese collector, Augustine Henry, near Ichang, which he designates as Buxus Henryi. As, however, the description is inadequate for the identification of his species, I have thought fit to amplify his diagnosis, basing my remarks upon Henry's specimens (No. 3,387), which are preserved at Kew, and which I presume to be conspecific.

A much-branched shrub, 6 feet high, second year's shoots more or less terete with exfoliating greyish, glabrous bark; current year's twigs straight, 3-4½ inches long, alternately compressedly quadrangular, smooth, greyish, and absolutely glabrous; internodes ⅓ to 1 inch long; axillary buds minute, puberulous; terminal buds long and slender, Beech-like; leaves opposite, spreading, lanceolate or broadly lanceolate, obtuse or minutely apiculate, narrowing gradually from below the middle into a scarcely perceptible grooved petiole, 2-2¾ inches long, ¾-1⅙ inch broad, thinly leathery and rigid, greyish-green above, paler below, distinctly penninerved and glabrous on both sides, the closely-parallel lateral veins with their accompanying reticulations not very patent; margin closely wavy and slightly recurved and cartilaginous; inflorescences axillary, opposite, scarcely exceeding half an inch, several-flowered, invested below with imbricate conspicuously scarious and greyish, oblong subacute or obovate ciliolate bracts, the inner of which are transparent.

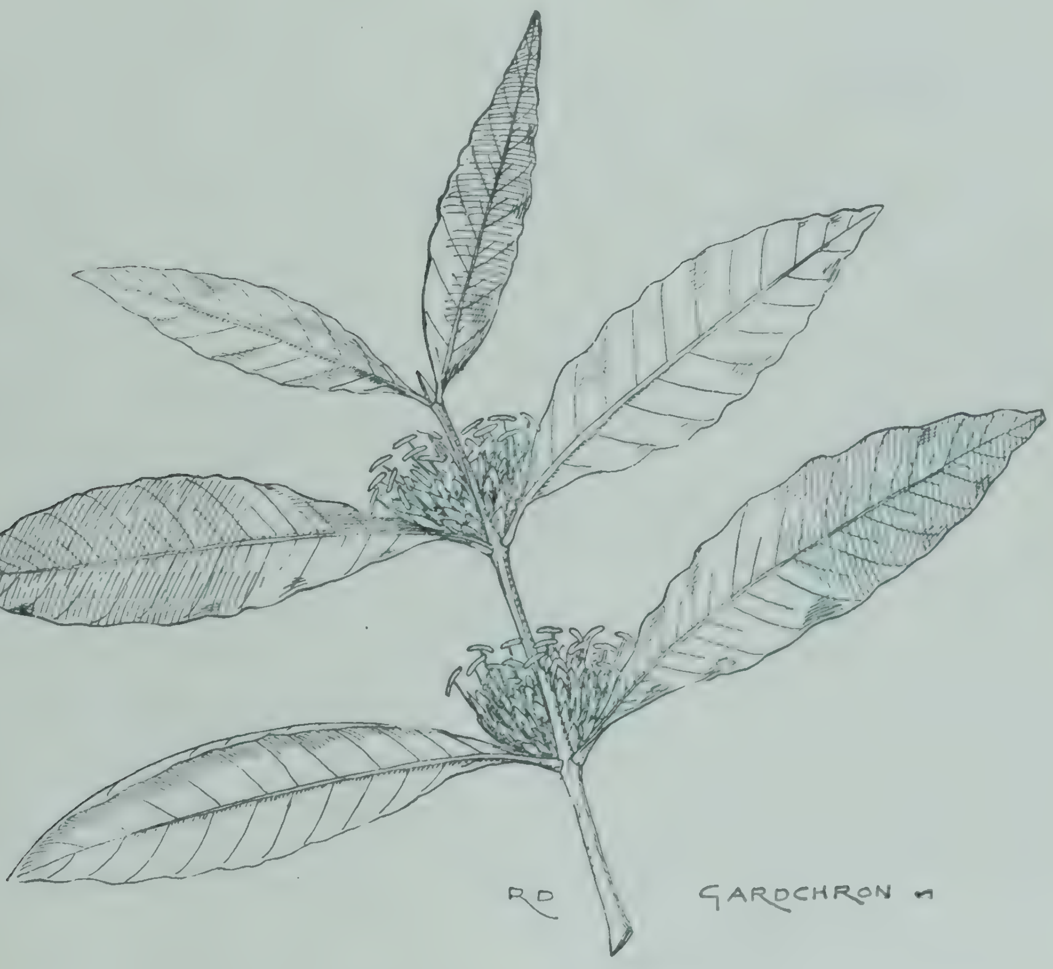

FIG. 182.—FLOWERS AND FOLIAGE OF BUXUS HENRYI.

The exceedingly large leaves of B. Henryi (see fig. 182) and its conspicuous inflorescences, with their exserted stamens, which suggest the species' affinity to the Balearic Box, would render it a desirable adjunct to the Boxes now obtaining in English horticulture. The desirability of its introduction is commended to the notice of plant-collectors in China. *R. A. Dümmer.*

ECHIUM WILDPRETII.

THE *Revue Horticole* for October 1 contains some notes and two illustrations by Dr. G. V. Perez, Teneriffe, on several species of Echium which grow wild in that island. One of these, E. Auberianum, now appears to me to be identical with E. Wildpretii, as grown at Kew since 1897, figured in the *Botanical Magazine*, t. 7847, and represented by a coloured plate in the *Gardeners' Chronicle* for October 26. In the note accompanying this plate I stated that E. Wildpretii was "distinct enough in foliage and habit from the other species found in Teneriffe" to be accepted as a good species. I have since carefully examined the specimens of this and other Echiums in the Kew herbarium and have read Dr. Perez's notes, and I am now convinced that the plant described by Webb as E. Auberianum, represented by the picture in the *Revue Horticole* and grown by Dr. Perez, is our E. Wildpretii. The following is a rough transcript of a portion of Dr Perez's notes. Writing of E. Auberianum, he says it grows in Teneriffe at an altitude of about 6,000 feet, and that a plant of it which flowered in his garden this year attained a height of 8 feet. The flowers are bright pink when they open, the pink of the Ivy-leaved Pelargonium Mme. Crousse, but their colour changes to purple as they age, and the two colours together give the whole spike the effect of brick-red, which is the colour shown in the *Gardeners' Chronicle* plate. The same species has also been named E. Bourgeauanum. Where it grows wild E Auberianum experiences frost; it is, in fact, the hardiest species in the island. It ought therefore to succeed out-of-doors in the warmer parts of this country.

Dr. Perez also mentions a hybrid Echium now growing in his garden which flowered for the first time last September. It was a chance seedling from an old plant of E. candicans, and owed its origin, he believes, to the intervention of bees which had carried pollen from the flowers of E. simplex growing near to the flowers of E. candicans. In habit the hybrid is more like E. simplex than E. candicans, though one of the plants bore three flower-spikes instead of only one, as E. simplex does. The flowers were a clear blue, about the same shade as the flowers of Plumbago capensis. E. simplex must be a magnificent object where it grows as it does in Teneriffe. Dr. Perez had a plant of it which when in flower was 11 feet high. Before flowering it forms a short-stemmed rosette about 4 feet in diameter, the leaves being 2 feet long by 4 inches wide. The three most striking species of Echium belonging to the Simplicia section and natives of Teneriffe appear to be E. simplex, E. Pininana, which has leaves nearly 3 feet by 6 inches, forming a single rosette about 5 feet through, and E. Auberianum (Wildpretii).

Eight years ago Lord Walsingham flowered several species of Echium in his garden at Merton Hall, Thetford. (See *The Garden*, July, 1904, p. 59.) One of these he had under the name of E. candicans giganteum, but from his description of the plant it must have been E. Auberianum, and not a variety of E. candicans, which is of branching habit and blue flowered. *W. W.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM SUPERBUM GIGANTEUM VAR. ROEBELENII.

THE variety Roebelenii is a white form of the well-known D. superbum, and one of the finest of the genus, not excepting even the grand D. Wardianum. The snow-white sepals and broad, undulated petals, with a deep violet and white lip, will make it one of the most desirable Orchids, both for exhibition purposes and the cut-flower trade. The large, showy blooms expand in October and November, when there are very few Dendrobiums in flower. The long, pendulous stems are not so strong as in the ordinary type, but very often they attain 6 to 7 feet in length. The flowers are set almost the whole length of the stem in twos, threes and fours; indeed, as many as 100 flowers have been counted on a single stem. Their perfume is not so pronounced as in the old type. D. superbum giganteum is found over the whole Eastern Archipelago as far as New Guinea, and from the Gulf of Bengal to the Gulf of Tonquin, but so far very few white forms have been found amongst them. It has been my good fortune to come across this fine variety, growing together with the old form, though it is by no means very plentiful and many big trees had to be felled to get a small lot together. D. superbum invariably grows in low grounds; warmth and plenty of moisture are necessary to their well-being. So far as I can see they never are entirely at rest; even in the dry season they push forth new growths. In their home the rainy season begins in November and lasts till May; then follows a very dry period, at the end of it the flowers expand and last in bloom for several weeks. They mostly grow on very high Teak trees, with very little shade from the overhanging branches. Plenty of water and decayed leaves falling between their roots seem to be quite essential to their well being and to enable them to produce such enormously long stems. Indeed, I cannot believe a small pot with a few crocks and a little Sphagnum-moss are sufficient to grow them successfully and keep them in perfection for any length of time, but this matter I have to leave to the wisdom and experience of growers at home. *C. Roebelen, Orchid Collector, Bangkok, October, 1912.* [Dried flowers are sent which well bear out Mr. Roebelen's remarks, but it may be well to state that three white forms are already in gardens, those known as Burkei (see *Gardeners' Chronicle*, 1884, vol. xxi, p. 306) and Hutton's variety (see *Gardeners' Chronicle*, 1869, p. 686) being apparently of the same class as that now described.—EDS.]

CORSICA.

THE Island of Corsica, which owes much of its fame to the fact that it was the birthplace of the great Napoleon, is no less interesting to the naturalist than to the historian.

It lies 106 miles from the coast of France, and 50 miles from the Italian shore. The Strait of Bonifacio, 6 miles in width, separates it from the Island of Sardinia. Corsica was formerly known as "L'île de Beauté," and it well deserves the name. A solid chain of mountains stretches along the middle of the island from north to south, and culminates in Monte Cinto, which is nearly 9,000 feet high. The central range throws several arms towards the sea, notably one in the east, which, intersected by deep valleys, ends abruptly at the coast, where the rocks rise sheer out of the water, and the shore is broken into innumerable gulfs. The western slopes are more gentle, and form wide, fertile valleys and plains, which were once known collectively as the granary of Rome. At the present day, unfortunately, the name is no longer applicable. From the mountains many torrents make their way to the valleys below, carrying with them large quantities of sand and small particles of rock, which so fill up the beds of the streams that the water overflows the land.

Malaria is rife in warm weather, and until lately no precautions were taken to prevent its ravages by destroying its agent, the mosquito.

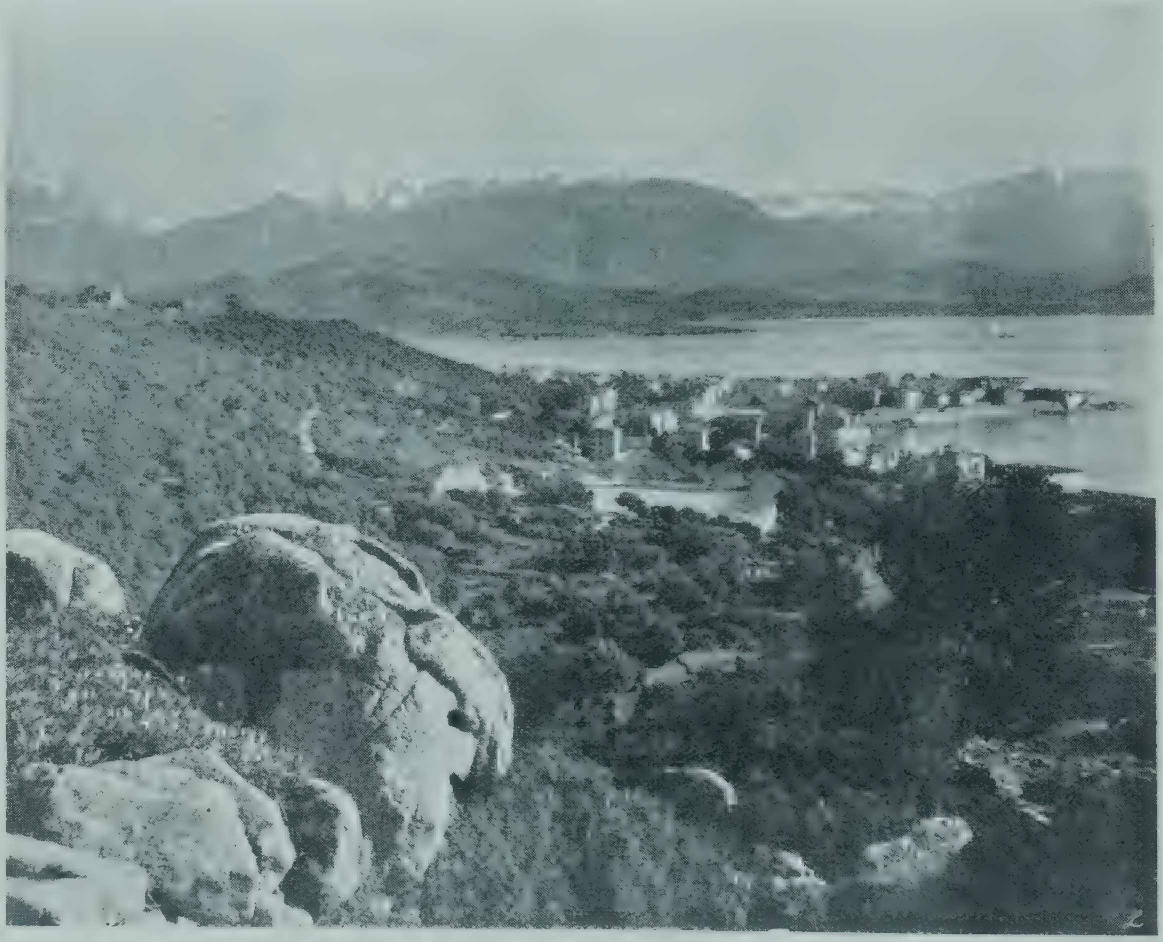
THE CLIMATE.

Owing to the mountainous and varied character of the land, the climate varies very much in different parts of the island. Broadly speaking, the climate may be said to be intermediate between that of the French Riviera and that of Algeria, but less extreme, owing to the influence of the sea. The island is of granitic formation, except for a small block of limestone in the south; its geology is curious and somewhat complex, igneous rocks cropping up in the strangest positions. The arable soils are mainly alluvial. They have been formed by deposits brought down from the mountains by the streams, and are of a light, sandy nature. In some places clay appears to have been formed by the atmospheric-weathering of granite rocks.

According to the latest report by the Hon. Henry Dundas,* only one-fifth of the island is cultivated; and even this estimate would seem high, since it is possible to traverse many miles without seeing any sign of cultivation. At first sight one might be tempted to blame the idleness of the population for this neglect, but it must be remembered that in some parts water is very scarce, and in the south five or six months of drought are by no means unusual. Again, malaria, as already stated, is extremely prevalent, and makes it impossible to live in the plains during the summer. A few months ago the sum of 12,000,000 francs was voted by France for the purpose of draining the eastern coast, in the hope of reducing malaria and restoring the ancient fertility of the plains. During the last few years the occupation of agriculture has received a certain stimulus in the shape of the formation of the "Syndicat Agricole"; and a change in the food-habits of the population has also operated favourably in this direction.

From an extremely remote period until recent times life in Corsica has been very easy. In every valley, as well as on the slopes of the granite hills, there grew in wild profusion a most useful tree—the Sweet Chestnut. The fruit, ground into a flour, formed the staple food of the people, who cooked it with goat's milk to make "pollenta," and ate it at every meal. Homemade cheese formed a large part of the diet, and also wild game, which the people shot at will—for every Corsican possesses and carries a gun. Unfortunately, a parasitic fungus has of recent years attacked the Sweet Chestnut, and, after ruining the plantations in the centre and south-west of France, made its appearance in the thick groves of Corsica. The attack of this disease is insidious and deadly. It usually makes itself apparent at the time that the trees affected have finished their annual growth. The leaves hang on the branches in autumn long after the healthy trees are bare. They fall ultimately, and no new leaves being formed, the tree dies. The process usually takes three or four years; and when the tree is cut down, the wood is found to be quite black, as if the sap has turned to ink; the disease is, indeed, known as the "ink" disease. A long series of investigations has been carried out by the French Government with a view to the identification and elimination of the fungus; but down to the present no remedy has been discovered.

Besides the "ink" disease, another enemy to the Chestnuts, scarcely less harmful, has made its appearance. This enemy is the tannin factory, which prepares tanning materials from the wood of the Sweet Chestnut trees. About £80,000 worth of extract of Chestnut-wood is exported annually to England and Germany to be used in the dyeing industry; and, dreading the fungus-disease, and attracted by the idea of getting ready money for his trees, the Corsican willingly sells his capital. Scarcely any young trees are planted in the place of those which are felled; with the result that in a few years, the owner of forest land is obliged to till it in order to get a living. In this way, agriculture slowly increases, and makes a certain amount of progress.



[Photograph by C. L. Digoy.

FIG. 183.—AJACCIO, SHOWING THE NUMEROUS OLIVE TREES ON THE OUTSKIRTS.

In spite of all the adverse circumstances against which the Chestnut trees have to contend, there are still some large forests in the island. The best are to be found in the districts of Orezza and Otto, and large quantities of the fruit are exported thence to Lyons, for the manufacture of "marrons glacés."

Many of the lower slopes are covered with Olive trees, especially in the district of Balagne, and all round Ajaccio (see fig. 183). The grey foliage of the Olive gives the landscape a peculiar aspect; somewhat dull at times, but with a certain beauty of its own, especially when a light wind stirs the leaves, which gleam and glitter in the bright Corsican sunshine. Numerous species of Citrus grow, and succeed very well, in the Corsican plains:—C. Aurantium (Orange), C. vulgaris (bitter Orange), C. decumana (Shaddock), C. medica (Citron), and C. nobilis (Mandarin). Cedrats and Lemons are exported in fairly large quantities, but the tree which thrives best is the Almond. There are several large plantations of this tree, and they could, no doubt, be increased, as Corsican almonds, which are very rich in flavour, find a ready market. A company, financed entirely by British capital, has been established for six years on two large plots outside Bastia; on one, there are about 10,000 Almond trees. Figs thrive almost anywhere, and the same may be said of Peaches. A little wine is made, chiefly in the north, around Cape Corso.

Very little in the way of horticulture proper has as yet been attempted. This seems a pity, as natural conditions are even better than in the Riviera itself. Round the towns of Ajaccio and Bastia there are a few private gardens, where Palms, Cacti, Araucarias, Acacias, and Eucalyptus grow exceedingly well. A few market gardeners grow various kinds of vegetables with success. New Potatos, Green Peas, and similar products are obtainable all through the winter; but the long period of drought makes gardening difficult in the summer. Attempts at growing flowers—notably Roses, Carnations, and Freesias—have proved successful; and, no doubt, when communication is more frequent, this branch of horticulture will increase.

THE CORSICAN FLORA.

In the preface to the *Flore Générale de la France* MM. Bonnier et de Layens say:—"As for the Isle of Corsica, its flora is so peculiar that we have not included it in our book." Corsica possesses, however, a large number of species in common with the neighbouring Continental coast; others are only met with in countries as far distant as Greece, Spain, and Algeria; which seems to point to a former connection between all these countries. Others, again, are indigenous to Corsica; but the native plants are becoming rarer each year, chiefly owing to increased means of communication. Of the plants indigenous to the island we may mention:—Draba Loiseleuri Boiss., Cistus corsicus Lois. Silene corsica D.C., Silene Requienii Ott (Melandrium Requienii

---

* Report on Corsica, by Consul the Hon. Henry Dundas, 1910.

Rohr), Erodium corsicum (a very pretty, freely-flowering rock plant), Ruta corsica, Gallium corsicum Spreng., Bellis Bernardii Boiss. and Reut, Aronicum corsicum D.C., Helichrysum frigidum, Linaria hepaticæfolia Duby, Mentha Requienii Benth., which forms a dense, strongly-scented carpet. Thymus herba-barona Lois, Helxine Soleirolii (of which there is a good border on the stage of No. 4 house at Kew) grows in the open in warm places.

The most striking feature of the Corsican flora is the "maquis." This is the name given to the thickly growing shrubs covering all the land which is not cultivated or wooded. Various species of Cistus form the greater part of the "maquis," the dominant forms being Cistus monspeliensis, L., with narrow, dark leaves, and white flowers; C. salvifolius, L., or sage-leaved Cistus. A natural hybrid, formed by a cross between C. monspeliensis and C. salvifolium often occurs, and is known as C. Flichei. C. incanus, L. (C. corsicus Lois), is quite distinct from the three first-named species, having wider leaves, and large, attractive-looking pink flowers. The aroma of the Cistus is perceptible a considerable distance out at sea; and Napoleon, the greatest of all Corsicans, wrote from St. Helena:—"La Corse! cette île enchantée! son odeur seule me la ferait reconnaître."

On the fresher slopes, the Strawberry tree (Arbutus Unedo) takes precedence of the Cistus, forming impenetrable thickets. The fruits ripen in December, and are used for making jam. Pistacia Lentiscus is common in the "maquis"; and also Erica arborea, which grows very tall, and when in bloom, in early spring, forms greyish-white pyramids. The roots of this Erica are sent to Ajaccio, where they are used for the manufacture of "briar" pipes.

Myrtus communis and Phillyrea angustifolia are much in favour in Continental gardens; they both grow in the "maquis," and the inhabitants of the island make baskets of the straight, young shoots of the Myrtus. Calycotome spinosa is conspicuous on account of its sharp thorns. It is a first-class hedging shrub, though somewhat bare in winter. The plant presents a charming appearance in early spring, when it is aglow with bright-yellow flowers. It has a peculiar advantage in that it is not nibbled by goats or rodents, all its parts being poisonous. There are several other plants of smaller size and less profusion, such as Daphne Gnidium, Genista corsica, Lavandula Stœchas, Psoralea bituminosa, Helianthemum Tuberaria, H. guttatum, Helichrysum tempis, H. angustifolium, &c.

Long, prickly trails of Smilax aspera and Asparagus acutifolius bind the shrubs together, and make them impenetrable. The general appearance of the "maquis" is that of a dark green carpet, relieved in winter by golden spots of Calycotome and Genista. In May, the Cistus are in bloom, and the "maquis" then looks at its best; but with June come the hot, dry winds from Algeria, which destroy the flowers and foliage, leaving everything burnt and reddish, and suggestive of an African landscape. In olden times the "maquis" formed a safe retreat for the outlaw flying from gendarmes or vendetta; but the days of banditti are over, and they are only seen on picture post-cards. The chief utility of the "maquis" shrubs at the present day consists in providing material for the manufacture of charcoal, of which 5,500 tons are exported annually. Bundles of Cistus and Lentisques are used by bakers as fuel for their ovens. Where the "maquis" has been destroyed and the ground abandoned, it quickly becomes covered with Asphodelus albus and Asparagus acutifolius. Asphodelus albus is attractive, with its tall, graceful spikes of white flowers. It has fleshy roots, which are very difficult to dig out of the soil when once they are established. *C. L. Digoy.*

(To be continued.)

FOREIGN CORRESPONDENCE.

THE BULGARIAN ROSE HARVEST.

It is part of the irony of history that the most sanguinary struggles sometimes take place in the fairest spots. The slopes of the Balkan Mountains are the Rose garden of South-eastern Europe. Once south of the Shipka Pass (so grimly held by the Turks in 1877-8), the traveller finds himself in the Valley of Flowers. Should it be late May or early June, the whole countryside (sloping upward to the snow-clad mountains, downward to the Maritza River, and thus forming a natural "South Wall") is red with the Musk Roses from which the famous "attar"—worth its weight in gold—is extracted, and gay with the songs of the girls and women who pick the Royal blossoms. Motley and picturesque are the flower-gatherers—here a group of veiled Mohammedan women, representing the daily diminishing Turkish element, there a bevy of Greek girls in native caps, fair-haired Russians or swarthy Albanians—for the native Bulgarian population is unequal to the daily task of picking the tons of blossoms necessary to produce a few pounds of the "essence," and workmen are recruited from far and wide. Nor can they gather for many hours daily, for the perfume distiller knows that the best results can only be obtained from flowers plucked at dawn or eventide, and once the sun is high in the heavens, work is suspended until the cooler hours. But many hands make light work, and the white-sleeved native girls and women (interspersed with a few lads, and reinforced by the foreign pickers) empty their baskets unceasingly into sacks which the long string of donkeys carries to the primitive distillery.

A simple thatched shed—a lean-to constructed against any convenient wall—a brick furnace surmounted by a rude alembic, a tub of cold spring water (constantly renewed by a gully from the mountain side) to cool the pipe, a large flask or bottle to receive the product—such is the rude factory in which the most precious liquid in the world is produced among the most picturesque surroundings. The valley of Damascus, the vale of Cashmere, Ghazipur, a few favoured spots in Italy and Sicily, and (last but not least) the French Riviera also produce the Rose, but Bulgaria fears no rival except the last-named. With ample wood to feed the distillery furnaces, running water to cool the alembic pipe, cheap peasant labour, a singularly suitable soil, and a site designed by Nature herself for a flower garden, the Valley of Roses is likely to hold its own for long years to come. This part of Bulgaria, at any rate, is—as a famous warrior remarked of another favoured land—"a country worth fighting for." *F. A. W.*

AGRICULTURAL EDUCATION IN FRANCE.

France has a way of doing without fuss, and merely because they are in accord with common sense, many things which other countries can only contrive after much talking and arduous campaigning. Among those things which they order better in France are the agricultural co-operative credit societies, and no higher tribute to the success of these societies is to be found than that contained in a report made by United States representatives to President Taft. That report states that as a consequence of this and other educative work done during the past 15 years in France, the value of the annual crops has been increased by £20,000,000.

Board of Agriculture Appointments to the Horticultural Branch.—The attention of our readers is directed to the announcements in another column of the intention of the Board of Agriculture to appoint a General Horticultural Inspector to the Horticultural Branch of the Department. In addition to the general inspectorship, appointments of two other inspectors will be made in connection with the work of the Board dealing with scheduled pests.

THE ROSARY.

CULTURAL NOTES FOR DECEMBER.

With respect to transplanting, it is unnecessary to repeat the advice given for November, except to insist upon a careful selection of varieties with a view to their individual habits of growth. This point is often neglected, and Roses are frequently found in places which are unsuited to their size and habit, especially in beds and borders of mixed varieties. Even with climbers and pillar Roses, a variety is often to be seen which only reaches to about half the desired height, and another which so overgrows its support as to be unsightly. A row of pillar Roses, or a border of dwarfs, should be all of the same, or nearly the same, height; and unless the habit of each is well known, it is worth while to make inquiry. As regards dates of flowering, the same care in selection should be exercised. These remarks have, perhaps, little to do with actual culture. They are merely suggestions, thrown out in the hope of preventing disappointment.

In exposed positions, some protection will probably be needed; but as little should be given as possible—coddling will do more harm than good to hardy varieties, and these are now so numerous that there is no excuse for growing tender ones out-of-doors. The best protection for dwarfs is supplied by drawing up the soil round the roots and base; this is better than heavy mulchings of rotten manure, which nearly always freezes and does more harm than good. The indiscriminate scattering of loose straw litter among the plants should also be avoided; this is only of use where they are exposed to a cold, frosty wind, and since the wind invariably blows the litter away, the plants are soon completely exposed to its biting influence. Branches or twigs of Fir (according to the size of the plants) are much better. They are more easily arranged, do not retain moisture, and are too heavy to be readily blown away. If the position is very exposed, it is a good plan to form a miniature hedge of the branches, laying a few among the plants as well. In the case of tender dwarf Roses (such as Ma Capucine) it is a good plan to stick a few branches of Birch among the plants; if taller than the Roses they keep off wind and hoar frost.

Ample light and air should be afforded at all times, both in summer and in winter.

ROSES UNDER GLASS.

There is little to be done indoors, except to bring a few more plants into the warmth, and to provide a slightly increased temperature for the first batch. January is probably the best time for starting the main batch, since there is a prospect of more light as they develop; though the sun may not be visible, the light is sensibly increased. The earliest of the grafted plants may be removed from the case, though they should be retained for a time in the same section of the house. This part of the subject of Rose culture, however, was so fully treated in the notes for November that it is unnecessary to go further into the same matter now. The same method should be continued until a sufficient number of plants are obtained. *Practice.*

NEW ROSES.—IV.

TEA-SCENTED ROSES.

(Concluded from p. 406.)

Mrs. Foley Hobbs (T., A. Dickson & Sons, 1910). This Rose is coming (or perhaps I should rather say has come) very rapidly into favour with exhibitors, some of whom regard it as the best Tea introduced since White Maman Cochet. It is ivory-white with a good high centre and plenty of petals; sometimes, particularly when grown under glass, it has a faint tinge of peach colour in the centre. The plant is strong, vigorous and hardy, and grows rather tall. It is certainly a very beautiful and perfect flower of distinct outline and firm, the edges of the petals of which are slightly indented or waved. and the flowers are freely produced. It is, however, not merely useful to the exhibitor, but is also an excellent garden Rose, and will become popular when known.

Mrs. Herbert Stevens (T., McGredy & Son, 1910). If Mrs. Foley Hobbs is one of the best Tea Roses for exhibition, the variety Mrs. Herbert Stevens must take its place among the best half-dozen decorative Roses of recent introduction. It is altogether a delightful Rose, both in the bud and in the flower. The colour is a pure white, and the buds long and pointed, while the flowers, with their long, shell-shaped petals of good substance and opaque, are most attractive. The flowers are thin and therefore open well. I should have thought them too small for exhibition, at least as a rule, but I am told that the flowers will come of large size if strictly disbudded. The flowers are fairly well carried on long stems, which make them most useful for decoration, while their highly artistic form and finish make them great favourites with ladies for wearing in the evening. The only things I have against this Rose are its slight tendency to mildew, and also that in my garden its growth has not been so vigorous as I could have wished, and the foliage is poor, but I am told I shall not have to complain of the growing power when the plants are fully established. I have only had my plants for a year, but have found the flowers most attractive and very freely produced. I think it a Rose that everyone should grow freely.

Mrs. Hubert Taylor (T., A. Dickson & Sons, 1909) on its introduction was spoken of as a more vigorous Mme. Cusin. It is certainly a strong grower, but the flowers are less attractive, and are paler than those of Mme. Cusin, being a pale rose-pink. Sometimes they are pretty and the plant is certainly a good doer, but I am often disappointed with its performance.

Molly Sharman Crawford (T., A. Dickson & Sons, 1908). I very early fell a victim to the charms of this beautiful Rose, which flowers continuously from one end of the summer to the other. The flowers are white, generally well shaped, and carried erect well above the foliage. The plant is fairly symmetrical, with beautiful foliage, red when young, and passing through bronze to green. It is a good grower, and has been perfectly hardy with me. It is specially good in hot weather, and I found its value in the hot summer of 1911, when so many Roses became useless, but it will also stand a certain amount of wet. Its weak points, if it has any, are that in cold weather the petals are apt to come slightly crinkled or rough on the surface, and that for its class it is a little, but not badly, subject to mildew. This notwithstanding, it is about the best white bedding Rose we have at present, and is a thoroughly good garden Rose, with a very pleasant Tea perfume.

Nita Weldon (T., A. Dickson & Sons, 1908) is another white Rose with a slight tint of buff. It seems a useful Rose for exhibition, and has not been a failure as a garden Rose, but it requires good cultivation.

Paula (T., Paul & Son, 1908). This Rose is said to have been raised by crossing a seedling from Maréchal Niel with a seedling from G. Nabonnand. It is lemon-yellow in colour, not very full, and a little too loose in shape, but a pretty decorative Rose. The plants are very bushy and well shaped, and flower freely and continuously. The flower has a pleasant fragrance.

W. R. Smith (T., Henderson, 1908) was raised as a cross between Kaiserin Augusta Victoria and Maman Cochet. The flowers are white with a tinge of blush, usually well formed and of plenty of substance, but not carried erect. The plant is a good grower, with plenty of foliage, of a good dark green, and seems free from mildew. It is a good Rose for exhibition and quite a fair garden plant. *White Rose.*

THE ALPINE GARDEN.

PRIMULA CARNIOLICA AT HOME.

Judging from catalogues, Primula carniolica should be a common plant in gardens. In point of fact it is a very rare one indeed (and hardly less so in nature), the plants that masquerade under its name being usually forms of P. glaucescens. The true P. carniolica is the third and least-known in the brevibracteate group, which also includes P. marginata and the magnificent true P. viscosa (also a very rare plant in gardens, where it sometimes slips in under the names of P. latifolia, P. graveolens, or P. cynoglossifolia). Of the three, P. viscosa has the widest distribution, ranging along the granite Alps from the Pyrenees. P. marginata belongs to the Maritime, Graian and Cottian Alps, but P. carniolica, despite its promising specific, is restricted to a very small district north of Trieste, on the wooded hill-tops round Idria, where, even so, it is of very local occurrence.

I have never been so far for a single species. For weary day after day one toils out to Vienna, and thence, for weary day after day, far down into the Southern Alps, until at last one has got utterly beyond all civilised peoples and languages, into a far corner of the world; where every word is alike unspellable and unpronounceable, built entirely of x's and z's, and rarely consists of fewer than ten syllables. Here, in its remote fastnesses, dwells Primula carniolica. The country is wooded and fertile, the hills are only of some 4-5,000 feet, and hardly, if at all, rise clear of the woodland. In the tumble of mountain ranges the eye is struck by the comfortable steadings that perch in cleared patches of culture all up their sides. And the whole Slavonian land gives an impression of ease and prosperity. The Slavs of this secluded hill-country have a nobler look than they show in more populous and central districts.

Even in its own realm it is not easy to come by P. carniolica, so sporadic is the distribution of the plant. One climbs by steep and stony tracks, over grassy slopes, ablaze in the late August with Michaelmas Daisy and lovely Cyclamen, up and up, by hot and sunburnt ways, over delusive summit after summit, each in turn showing a fresh apparent summit in the distance, until one is hot and anxious indeed. For all the way, no matter at what height, there is no sign whatever of the Primula—no, not even when you are well within the zone where all right-minded Primulas have the habit of being found. I ranged from likely spot to likely spot, and from each returned empty to the track. To have come so far—! And meanwhile Omphalodes verna was the only thing of interest I saw; and there were now, of course, no more flowers. Ultimately, though I had precise directions, it was in a cold sweat of misery that I climbed at last empty-handed into the icy wind that swept the summit of the hill; and still I had found nothing. Here, however, was a mown meadow, with heaps of stone picked off to clear it, and piled up. On the far side was another steep and wooded slope facing the north, and here, in the grass on the shady side of the stone piles, just as I was longing for death, suddenly began P. carniolica.

In the grass the Primula was poorly, and had a depressed, unhappy look, struggling with long trunks along the ground. It was down in the wood below that it belonged and abounded in rich luxuriance in the dense shade, thriving in the deep wads of moss, and on the damp faces and ledges of shady rocks. This rare and wonderful Primula differs wholly in character from its two relations (and from all its section, indeed). It is not a saxatile plant like P. marginata. It is not an open-air plant like P. viscosa. It loves obscurity and moss and moisture, and, alone of all our Alpine Primulas, rejoices in rich, cool, and copsy corners, such as might suit the common Primrose. Here, in deep sponges of moss, it forms wide, straggling plants, sending out its woody trunks through the soft expanse. Here and there spring its tufts of leaves, which are long and oval and slack in texture, rather glossy, and absolutely devoid of hairs or powder. They die utterly away in autumn, and the green bud of next year's foliage alone remains to tell you that the plant is there. When I found it the leaves were yellowing, and I was disappointed to find only one seed-head. It would seem that it flowers sparsely at home. With me, in an open but not sunny border, it grows robustly, and flowers more readily than almost any other. The flowers are of quite remarkable beauty, even among Primulas. They are carried in loose heads of 3-6, on rather flaccid, smooth, green stems of some 6 or 8 inches, and are large, splendid and round, of a very delicate, lovely rose-pink, with a conspicuous mealy eye, and an exquisite scent. There has been found, of course, an albino form, which must be lovely. In my own case, as all the flower was over, I must trust to luck for it, and to my pertinacity in searching out such plants as had a pallid look in their leaves. In the same station, too, has been rarely recorded the beautiful hybrid of P. carniolica with P. Auricula—that P. × venusta which, crossed again with its maternal aunt P. marginata, has resulted in the glorious violet of the secondary hybrid P. × Marven. But, though I quested eagerly, I caught no glimpse of P. venusta, nor indeed did I ever succeed in sighting any form of P. Auricula. However, long and far and arduous and expensive as the journey may be, it is not wasted time or cash if it yields such a first-class treasure of beauty and vigour as the very rare and remote P. carniolica, most shy, secluded and romantic of its race—hardly excepting even the no less rare and misrepresented P. Allionii. *Reginald Farrer.*

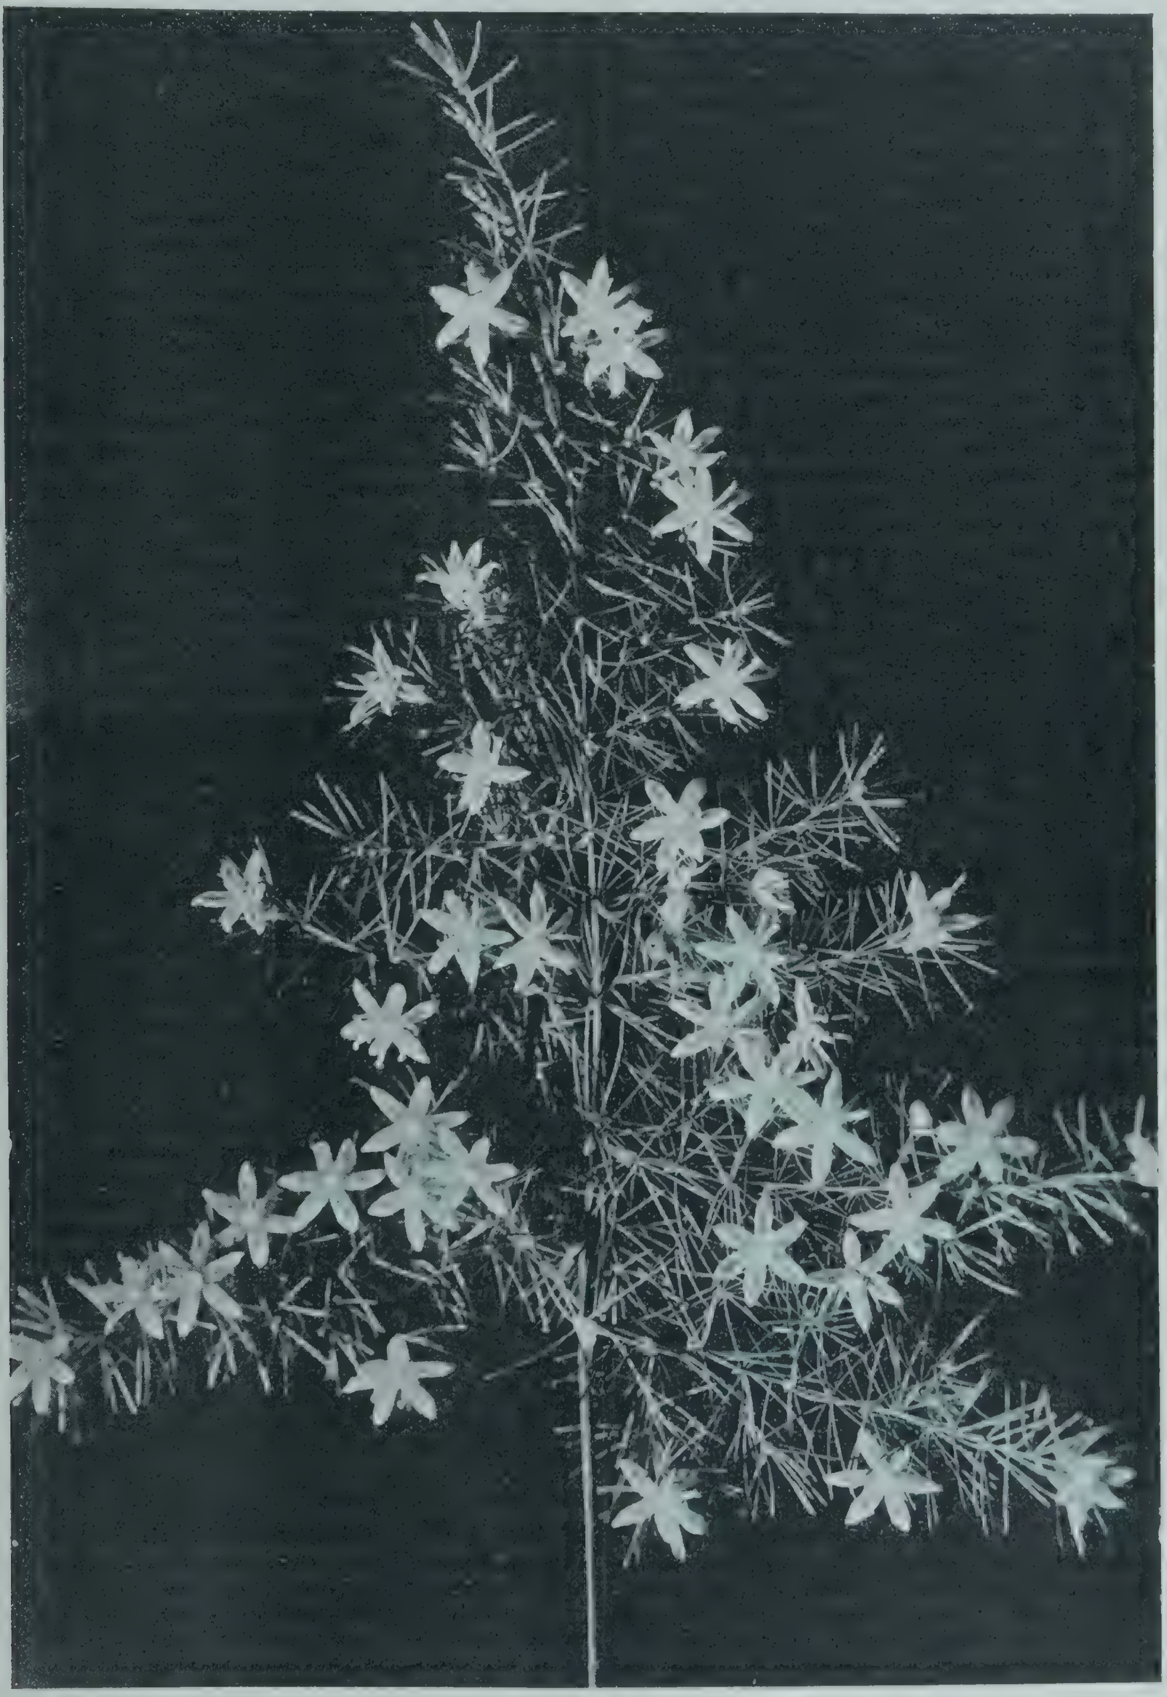

Fig. 185.—Flowering spray of Asparagus Lutzii.

NOTICES OF BOOKS.

British Violets.*

In this volume Mrs. Gregory has brought together the result of more than a quarter of a century's work on the British Violets; that is to say, the species of Viola of the section Nominium, which excludes the Pansies (V. tricolor, &c.).

Mrs. Gregory has not only studied the plants in the field, but also under cultivation, and has examined the material in the collections at the British Museum, Kew, and Cambridge, and also specimens sent by numerous correspondents. Twelve species are recognised: Viola odorata, V. hirta, V. calcarea, V. palustris, and V. epipsila of the group Acaules, and V. silvestris, V. Riviniana, V. rupestris, V. canina, V. lactea, V. stagnina, and V. montana of the Caulescentes group. Hooker's *Student's Flora* (Ed. 3, 1884) recognised six species, while the recent edition of Babington's *Manual*, by Messrs. Groves (1904) gives eight. The additional species are (1) Viola calcarea (Gregory), a segregate from V. hirta, which Babington had included with other forms as a variety of that species, and which was restricted and defined by Mrs. Gregory in the *Journal of Botany*, 1904. Though when thus restricted it is a widely different plant in appearance from typical V. hirta, Mrs. Gregory is fain to admit that the two are connected by a whole series of intermediates. (2) V. epipsila (Ledebour) was first detected by Mrs. Gregory as a British plant from South Devon, and has since been noted from other localities in southern England, Wales, and Ireland. It is very closely related to V. palustris, but kept distinct in most European floras. (3) V. lactea (Smith), which British botanists have regarded generally as a subspecies of V. canina. (4) V. montana (L.), discovered in Woodwalton Fen, Huntingdon, in 1905. This is synonymous with V. nemoralis (Kützing), a German and Scandinavian plant, but the author expresses her doubts as to its validity as a good species, and would "not be surprised if it turned out to be a hybrid between V. canina var. lucorum and V. stagnina."

Under each species is cited its synonymy; this is followed by a detailed description of the plant and its parts, various notes, and details of distribution in the British Isles. The numerous varieties, forms, and hybrids are discussed in detail and at length An important feature of the book are the numerous excellent illustrations, partly reproductions of photographs and partly line drawings, the latter by Miss W. Mills. Mr. G. C. Druce supplies an introduction, in which he reviews the history of our knowledge of the British Violets. Mrs. Gregory also acknowledges his help, along with that of other workers at British botany, in her preface.

The book is very clearly printed, and forms a valuable addition to the literature of the critical study of the British flora. Mrs. Gregory is to be congratulated on the completion of a useful piece of work. *A. B. R.*

ASPARAGUS LUTZII.

The new Asparagus, A. Lutzii, illustrated in fig. 185, was raised by Mr. Lutz, of Bingen-on-Rhine, from seed obtained by crossing A. plumosus nanus and another species of Asparagus.

The hybrid is characterised by upright and vigorous growth, by good-sized short shoots (the so-called leaves), and by freedom and persistence of flowering.

As shown in fig. 185 the branches, which reach a height of upwards of 6 feet, grow fairly erect, and exhibit but little trace of the climbing habit. They may be tied to bamboo stakes or to vertical wires. It would appear from the photographs and description which the raiser has sent to us that the hybrid A. Lutzii will prove useful both for decorative and cutting purposes.

KEW NOTES.

CRATÆGUS CARRIEREI.

THIS hybrid Thorn originated in France, the reputed parents being C. mexicana and C. prunifolia. On the Continent the name C. Lavallei is sometimes used for the same hybrid. Its most valuable character is that the fruits hang on the trees till December, its only rival in the Thorn collection at Kew at the present time being one of the parents, C. mexicana. The fruits of this species are yellow, forming a pleasing contrast to the rich orange-red fruits of the hybrid. Carrière's Thorn is also a showy tree when in flower, with corymbs of white blossoms half-an-inch across, prettily relieved with pink stamens. The fruits are ¾ inch in diameter, borne 10 to 18 in a bunch. Previous to falling in late autumn the leaves assume a shining bronzy-red hue.

CRATÆGUS OXYACANTHA PRÆCOX, THE GLASTONBURY THORN.

JUDGED by the number of inquiries for this remarkable tree by visitors, this is the most popular tree in the outdoor garden at the present time. The flowering season of the Thorns is May, but, in addition to producing blossoms at that time, the Glastonbury Thorn flowers more or less freely between November and March. A tree in the Thorn avenue south of the temperate house is at the present time flowering freely, while there are also a considerable number of ripe fruits from the May flowers. The legend of the Glastonbury Thorn is that, when Joseph of Arimathea landed in this country to preach the Gospel, he brought with him a staff of Thorn wood. At night, while he slept, he fixed the staff in the ground. In the morning when he awoke, according to the legend, the staff had taken root and was covered with white blossoms.

DAHLIA IMPERIALIS.

A FINE specimen of this striking Mexican plant is flowering in the succulent or Cactus house No. 5. From the fact of its not flowering till early winter it is necessary to grow the plants in large pots or tubs, and remove them from outside, where they may be grown during the summer, to a cool greenhouse at the first sign of frost in autumn. The plant in question has five vigorous growths about 9 feet in height, terminating in panicles of white blossoms, faintly tinged with mauve.

COTONEASTER PANNOSA.

THIS Chinese species was first collected and sent to France by a missionary about a dozen years ago. It is now represented at Kew by a large bush, 6 feet to 7 feet high. The larger branches are upright, the younger ones slender and semi-drooping. The leaves are small, the red fruits are also on the small side and very freely borne on the branchlets. These seem less attractive to the birds than other species, for the birds have only just commenced to eat them, while most of the fruits are gone from the surrounding bushes of other species, except C. rotundifolia.

A VINE PERGOLA.

THE need for a better position for the collection of Vitis and one where the many varied species and varieties might be better observed and compared has long been felt desirable. Consequently, an iron pergola is now in course of construction between the refreshment kiosk and the Rose dell. Running N.E. to S.W., the pergola is about 150 yards in length; the uprights and crossbars are of 1 inch barrel iron, having an outside diameter of 1⅜ inch. Along the sides the uprights are connected with galvanised chains. To each upright three wires are fixed, tripod fashion, standing out about 1 foot from the base as additional support for the growths of the Vitis. The pergola is 10 feet high, 11 feet wide, with an average of about 12 feet between each pair of standards, of which there are 41 on either side, 82 in all. *K.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME, Warter Priory, Yorkshire.

GROUND OPERATION.—The work of root-pruning, lifting and removal of fruit trees has been carried out under exceptionally favourable conditions. Continue these operations whilst the weather remains mild, for, if delayed, cold rains and snow may prevent the work being done until very late in the spring. It is not so necessary in the case of light, sandy soils, that may be worked within 24 hours after rain. Trees on light soils soon become exhausted unless they are top-dressed frequently, and the fruits thinned. Drainage is another operation which should be done at this season; this work is often neglected, but it is very important, especially when preparing land for orchards. Fork up the soil where fruit trees are growing, but take care not to injure the roots. If healthy roots are found near to the surface, apply a good dressing of manure or compost similar to that recommended in a previous Calendar. Road scrapings, hedge trimmings, prunings and other refuse charred in the fire heap will furnish valuable material to supplement animal manures.

INSECT PESTS.—The present is the best time in the whole year for clearing the trees of insect pests, for growth is dormant and strong specifics may be employed. Follow out previous directions given in Calendars for the destruction of American blight, mussel scale and winter moth. It is not sufficient to spray old, cankered branches infested with American blight and aphis; the specific should be well worked into the crevices with a half-worn painter's brush. It is not an easy matter to destroy by spraying scale insects on old badly-infested Pears: the rough bark should be treated with a brush. Quick-lime dusted freely over the trees will destroy many insects, keep the bark clean, and prove of great value to the roots.

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

MANAGEMENT OF ORCHID HOUSES.—Great care must be exercised in regulating the temperatures and the atmospheric conditions of the Orchid houses in winter: endeavour to keep the temperature as even as possible. During frosty weather, when much fire-heat is necessary, the atmosphere should be prevented from becoming too dry. On bright mornings following frosty nights, as soon as the temperature commences to rise to the proper degree, every available space should be moistened thoroughly by syringing; the stages, bare spaces between the pots, the paths and underneath the hot-water pipes should all be damped. At the same time water any plants that are dry. Houses with paths formed of iron gratings or wooden lattice work over the natural earth will not require damping so much as those with paved or tiled floors. The East Indian, Cattleya and intermediate houses should be damped between 2 and 3 p.m. One damping should suffice in the Odontoglossum house, but at all times the amount of atmospheric moisture should be regulated according to the weather.

TEMPERATURES.—The night temperatures of the various houses should be regulated as nearly as possible as follow:—East Indian house, 63° to 68°; Cattleya house, 58° to 63°; intermediate house, 55° to 58°, and Odontoglossum house, 48° to 52°. On very cold nights the lower temperatures will be sufficient, as an excess of fire-heat may prove harmful to the plants. The houses should be warmest at mid-day. During very cold weather, the temperature should be about 5° warmer at mid-day than in the early morning, but the thermometer may be allowed to rise several degrees higher during periods of bright sunshine. If lath blinds are fixed to the houses, they should be lowered during cold nights; if permanent blinds are not used, the glass should be protected by some other covering, such as waterproof canvas or archangel mats. Their use will prevent the temperature from fluctuating, economise fuel, and keep the atmosphere from becoming very dry.

VENTILATING.—Admit fresh air when it is possible to do so without lowering the temperature or chilling the plants. Air is best admitted through the bottom ventilators, which should be arranged so that the cold air becomes warmed somewhat by passing over the hot-water pipes. The ventilators on the side sheltered from the wind should be opened first, and, as the temperature in the house rises, those on the other side may be opened a little to cause the air to circulate.

LYCASTE.—The flower-buds of Lycaste Skinneri and its variety alba are well advanced, and the plants should be grown in a light position in a house having an intermediate temperature. As the flowers approach their full development, the plants should be subjected to moderately dry conditions. Only sufficient water should be applied to the roots to prevent the pseudo-bulbs from shrivelling. Weakly plants should have the flower-buds removed as soon as they appear. These remarks apply also to **L. Balliæ**, **L. Mary Gratrix**, **L. leucantha** and **L. cruenta**. The deciduous species such as **L. aromatica** and **L. cochleata** should be rested as soon as the pseudo-bulbs are fully developed. Water should only be applied when the pseudo-bulbs show signs of shrivelling.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

EARLY POT FIGS.—Forcing may be commenced by plunging the pots in a moderately warm hot-bed. The trees should be placed near to the roof-glass, so that they may receive plenty of light. The temperature of the house should be 55° or 60° at night, with a rise of 5° during the day. Water the roots carefully and regulate the amount of syringing and damping in accordance with the weather conditions. On every favourable opportunity admit a little fresh air to the trees.

EARLY FIG TREES IN BORDERS.—The date of starting the permanent trees into growth must be regulated largely by the season when ripe fruits are in the greatest demand. If the wood is ripened thoroughly, it is an advantage to start the trees early to allow the fruits to ripen slowly, rather than to attempt to hurry them at the last moment, as Figs are impatient of hard forcing. It is usually about five months from the time the house is closed before the fruits are ripe. Although the young growths were stopped and thinned in the summer, the trees must be again examined carefully, and if there is a superabundance of growth, the shoots must be liberally thinned. It is a good plan to cut out a few of the old branches annually to allow plenty of room for young fruiting wood. Remove all suckers unless the base of the tree is becoming bare, in which case one or two shoots may be retained. If the trees are affected with mealy-bug, special measures must be taken, as this pest breeds very quickly on the Fig. The trellis may be thoroughly cleaned of mealy-bug by painting it with paraffin. The interior of the house should be subjected to a thorough cleansing and the brickwork lime-washed. When this work has been finished, remove 2 or 3 inches of soil from the surface of the border, and top-dress with turfy loam mixed with plenty of old brick rubble and wood ashes.

EARLY POT VINES.—As soon as the buds show signs of bursting into growth, raise the temperature 5°, and more as growth proceeds. Make sure that the buds are breaking freely from top to bottom of the canes before releasing the vines from their present horizontal position to tie them in their permanent place on the trellis. If the latter is very close to the glass, the rods may be fastened a few inches below it. Remove all surplus shoots as soon as it can be determined which are the best laterals to retain. It is a mistake to allow the vines to form useless growth or too many bunches, therefore, when they have made sufficient growth to fill the trellis, all surplus laterals should be removed. Water the roots with great care. When moisture is necessary, give two soakings as a safeguard against the soil becoming dry in the centre of the ball of roots. If the tank in the vinery is filled every night, the water will be always suitably warmed; for syringing rain-water is preferable. Replenish the hot-bed with fresh litter and leaves at intervals, after first preparing them thoroughly. Discontinue syringing when the buds have burst freely into growth, but promote a moist atmosphere by damping the bare surfaces as often as necessary.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

Carnations.—Layers of Souvenir de la Malmaison Carnation which were potted during the latter part of August or during September should now be sufficiently well rooted to allow of a transfer into 6-inch pots. It may be considered a little early, but I find that by early potting better rooting is secured and compacter growth. Before being repotted, the plants should be examined, and any foliage affected with rust removed and burnt. As the plants are taken out of the first pots they should be dipped in a solution of sulphide of potassium (½ ounce to a gallon of water), and then placed on the floor of the house. If they are placed on the shelves the solution will mark the paint, and such marks are very difficult to remove. The compost for "Malmaison" Carnations need not be of a very elaborate composition. A good fibrous yellow loam is the chief necessity, of the proper texture and sufficiently porous. It should not require the addition of any quantity of leaf-mould or manure; a good proportion of finely-broken crocks, brick, and lime rubble is recommended with perhaps the addition of a little wood ash and bonemeal. If the plants are subject to attacks of eel-worm sterilised soil should be used. This should have been prepared some time since, as freshly sterilised soil is discouraging for rooting purposes, especially if it has been sterilised by the drying process. The potting should be carried out firmly and evenly, and a small stake placed in each pot. If this is done and the stake tied to the plant in one place, further support will be unnecessary until the plant begins to form flower-shoots. The pots may be placed closely together at present, but when the side growths begin to come more space will be needed. If the soil is fairly moist at the time of repotting, the watering-in may be deferred for a few days, when all the plants should be given a thorough moistening. After this stage very careful watering will be necessary, as a damp condition results in yellow, drooping foliage, and fast growth. If they are kept fairly dry they will grow slowly and hardily, especially if liberal ventilation is provided in all weathers. This latter condition must be subject to sufficient heat being kept in the water pipes to maintain the dryness of the atmosphere in the house.

Perpetual-flowering Carnations.—At this dull season of the year perpetual-flowering varieties will be somewhat slow in opening, but they should not be forced, or weak stems and anæmic flowers will be the result. The water-pipes immediately beneath the stages should not be overheated, or the plants will be attacked by red spider. Where there are pipes under the stages, it is as well to sprinkle a little sulphur over them in order to discourage the pest; but this precaution will not obviate the necessity of exercising the utmost care not to overheat the pipes or close the top ventilators, which often leads to the plants being burnt. I have noticed this season what a fine variety "Triumph" is. This new crimson, though hardly, perhaps, to be classed with "Carola" in point of size, has all the points of a good perpetual Carnation; down to the present I have not seen a single split calyx, and it lasts in water extremely well. "Mary Allwood" and "Salmon Enchantress" should also prove good varieties; they both gained awards at the R.H.S. They are distinct in colour, and the form of the first-named is as good as that of many of our best border varieties.

Propagation.—Cuttings put in now will root more readily than if left to any other time. They are naturally hardier than if the planting is left until the spring, and they make a good deal of root without much top growth, which is a decided advantage. A high temperature is not essential; it is, in fact, prejudicial. An overhead heat of 50° to 55° is ample, with a slight degree of bottom warmth. The cuttings may be rooted in pots, boxes, or in a shallow bed; if large numbers are required, the latter method is probably the best. They will root well in a mixture of sand, finely pounded brick or crock rubble, and just a little loam. They should be ready for potting quite early in the New Year, and will then have a long season before them in which to mature their growth.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Protection Against Frost.—Since the severe frost in the early part of October the weather has remained fairly mild, and the rainfall has exceeded the average. Most of the vegetable crops cultivated with a view to autumn and winter requirements, are looking remarkably well. Indeed, they are rather too luxuriant, and there may be extensive damage in the event of a sudden severe frost. Some slight protection should be held in readiness, if possible, in order to guard against this contingency; it is well worth while, especially with tender plants. The kitchen garden should be made perfectly tidy, not only for the sake of appearances, but also because it is beneficial to the crops. This important part of the work should be completed by Christmas. It will be particularly easy this year, on account of the trees having shed their leaves earlier than usual.

Asparagus.—This is one of the easiest vegetables to force if good crowns are employed and the hotbed well prepared and sufficiently mild. During severe weather the frames and lights should be protected, but in favourable circumstances a reasonable amount of ventilation is essential.

Winter Broccoli.—This crop seems particularly promising, and many of the earlier varieties are already yielding a good supply. The plants should be examined frequently, and the leaves tied securely over the curds. Whenever there seems a likelihood of severe frost, a little light protective material, such as bracken or straw, should be placed over and around them.

Turnips.—These are also in a very satisfactory condition. Those which are fully matured should be taken up and placed thinly together under a north wall. When stacking, some finely-sifted ashes should be placed between each layer, and room for ventilation should be left. The stacks must not be too large. A little soil should be drawn over any turnips which are not yet matured.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Clematis.—If good varieties of each section of Clematis are planted in different situations, they will provide continuous blooms from May or June until the end of October. The most beautiful colours are represented in this family, notably very fine shades of purple, lavender, and violet, not to be found in many species. Clematis plants are grown in pots for sale by most nurserymen, and they are most convenient in this form, since they can be transplanted at almost any time without risk. The present season, when the ground can be thoroughly prepared by deep trenching and manuring, is a favourable time for planting. The Clematis is a gross feeder. It has a partiality for chalk or lime; if this substance is not naturally present in the soil some should be added. Mortar rubble is a convenient form in which to provide it. Clematis can be planted in all sorts of positions, and will seldom look out of place. The plants can be used to cover walls, pergolas, and trellis work; to adorn rustic poles, such as light Larch tops; to brighten a porch or a lich-gate. It can be used in conjunction with other climbers, such as Roses; if several different varieties are planted in this way, the blooming period will precede, and outlive, that of the Roses. Clematis can also be planted with great effect to enliven the more sombre corners of the shrubbery, either winding up and over artificial poles, or climbing naturally over some of the more strongly-growing shrubs. When once established the majority of Clematis varieties grow very quickly, and soon cover a large area. All are beautiful, but a short list of varieties in each section may be useful, especially the information as regards the flowering period. C. lanuginosa:—Flowers from June to October This section comprises some of the finest varieties: Nellie Moser, Beauty of Worcester, Queen Alexandra, Mme. van Houtte, La France, and King Edward VII. C. Jackmannii and C. viticella:—The flowering period of the plants in these sections is rather later than in the preceding one, lasting until late in the autumn. Jackmannii superba, and J. alba and rubra, Star of India, Lady Bovill, ascotiensis, and the newer Lady Northcliffe. C. patens section:—This type is the earliest to bloom, and includes the varieties Fair Rosamond, Duke of Edinburgh, Albert Victor, and Lady Londesborough. C. florida:—The varieties in this section flower in June and July. Belle of Woking, Duchess of Edinburgh, John Gould Veitch, and Venus Victrix are the chief varieties. Other good Clematises should be included if possible, such as C. montana (grandiflora and rubens), both very floriferous, the former white and the latter rosy-pink. These both flower in June. Also C. flammula, a small-flowered, sweetly-scented species, flowering in August. The hybrids from C. coccinea, such as Countess of Onslow and Duchess of Albany, flower over a long period.

General Work.—At present the work out-of-doors is hindered by the inclement weather. There has been very little frost so far, and until the end of November the weather was exceptionally open; but continual rain has rendered planting almost impossible. There are, however, indications of improvement, and it is better to wait for a favourable opportunity than to put choice plants into the ground in its present condition. Such work as clearing away worn-out and weedy shrubs (Laurels, &c.) can be done in almost any weather. The ground should be thoroughly cleared of all roots, especially those of Nettles, Woodbine, and other perennial weeds which accumulate in neglected shrubberies. These should be burnt at once, in order to make sure that they are not mixed with leaves and thus returned to the ground; such a mistake would cause much trouble in the following season.

THE APIARY.

By Chloris.

Feeding.—Those who have neglected the feeding of their bees should lose no time in making some good, soft, buttery candy, free from crystals. A sufficient quantity should be placed under the quilts to last until the end of January. The bees should be manipulated as little as possible; any excitement will lead to a larger consumption of food. This reduces the stores to an unnecessary degree, and is very bad for the bees. Indeed, unless a surfeit can be worked off by a cleansing flight, the result is often an attack of dysentery.

Combs Laden with Pollen.—If the combs are exceptionally full of pollen, they are useless for storing, and should be melted down for wax. The pollen becomes very hard, and the bees are obliged to gnaw away the loaded cells and rebuild them before they can be used again. The waste matter falls on the floor-board, where it accumulates, and encourages the entrance of the wax moth, which lays its eggs in the waste.

Partly-filled Sections.—These are a source of considerable anxiety to beginners, who often wonder whether they can be utilised again or not. The fact is that they are of great value in the early spring, used as bait-sections; when fitting up the section racks, they should not be placed in the centre, but round the outside. They should be stored until the spring in a dark, warm, dry place, or the honey will foment.

Beekeepers' Associations.—These societies would perform a most useful function if they were to arrange exhibitions of bee products during the autumn and winter, as well as demonstrations and shows in the summer. Up-to-date appliances might form the subject of one class, and a sale stall for the honey would probably be found remunerative, as well as popularising what is really a very valuable article of diet. It can be used for sweetening tea, coffee and cocoa instead of sugar. In cakes it has been found most successful, as they remain moist much longer than when sugar is used. Honey has also a distinct medicinal value. Points such as these might be selected for the topics of an occasional lecture.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plant for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

APPOINTMENTS.

SATURDAY, DECEMBER 7—
Soc. Française d'Hort. de Londres meet.

MONDAY, DECEMBER 9—
United Hort. Benefit and Prov. Soc. Com. meet.

WEDNESDAY, DECEMBER 11—
North of England Hort. Soc. meet. at Leeds.

Average Mean Temperature for the ensuing week deduced from observations during the last Fifty Years at Greenwich—41·2.

Actual Temperatures:—

London.—*Wednesday, December 4* (6 p.m.) Max. 52°; Min. 44°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, December 5* (10 a.m.): Bar. 30·0°; Temp. 43°; *Weather*—Overcast.

Provinces.—*Wednesday, December 4:* Max. 52° Shields · Min. 45° Margate.

SALES FOR THE ENSUING WEEK.

MONDAY—
Bulbs and Herbaceous Plants, at 12; Roses, at 1.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

MONDAY and WEDNESDAY—
Roses, Perennials, Lilies and other Bulbs, at Stevens's Rooms, 38, King Street, Covent Garden, W.C., at 12.30.

WEDNESDAY—
Dutch Bulbs, Hardy Border and other Plants, at 12; Palms and Plants, at 5, at Protheroe & Morris's Rooms
Special Sale of Roses, at 12.30, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
Orchids, at Protheroe & Morris's Rooms, at 12.45.

The Acclimatation of Plants.

Much has been written on the subject of the acclimatation of plants; but little is known of the nature of the process whereby a species becomes acclimatised. As with so many other phenomena of variation, so with respect to this, two opposed views are held. On the one hand, it is suggested that a species is plastic, and hence capable of responding to a definite change of conditions by an equally definite change in constitution. If this view —that circumstances alter species—be accepted, a comprehension of the process of acclimatation would seem to present no difficulty. A plant brought, for example, from a warm to a cold climate responds to the stimulus of change of temperature. This response, which takes the form of a gradual or rapid change of structure and metabolism, results in an immediate or gradual increase in the power of resistance to low temperatures.

To discuss this hypothesis adequately would require one or several articles devoted exclusively to that purpose, and would carry us, moreover, beyond our present object, which is rather to state the alternatives than to prove or disprove them.

Acclimatation on the foregoing hypothesis is a special case of variation, and of adaptability, which properties are admitted universally to be attributes of plants.

The alternative hypothesis holds that the permanent acquisition of hardiness by a plant translated from a warmer to a colder region is not a phenomenon of adaptability, and, indeed, is not due to the acquisition by the plant of a new character, but to the manifestation on the part of certain members of the species of a character which they possessed already, before their change of habitat.

According to this interpretation, the several members of a species differ widely from one another in many and subtle ways. Though these differences are not of such a kind as to make themselves manifest to the eye, they are none the less real and permanent. When the members of a species are introduced into a new country in which the conditions differ from those of the natural habitat, certain individuals may survive, and others may die. The survivors are those which possessed already before their introduction such a constitution as enables them to withstand the changed conditions. Nor may it be supposed that we are dealing here with fine-drawn distinctions and mere scholastic quibbles. For, according as the acclimatisor holds one or other of these alternative views, so his practical method will vary.

If he believe in the adaptation theory he will be content to introduce a fair number of plants, and to so grow them that they are inured gradually to the new conditions. He will hope that by this procedure the principle of adaptability may be given time to act, and that each year will see a movement in the direction of increased hardiness.

If, however, he hold to the opposite view, his method will be different altogether. If the plant be one of which he can obtain seed in large quantity, he will provide himself with a plentiful supply of seed and so plant it that the seedlings are exposed to all the rigours of the new climate. His hope will be that if any of the plants survive the test, the offspring of the survivors will be found also to be hardy. If, however, the acclimatisor is able to obtain a few plants only, he will grow those plants under sheltered conditions until he has been able to work up a large stock, which he will then subject to the decisive test of exposure.

He will go further than this, and if any of the plants survive the test, the acclimatisor will not only save self-fertilised seed, but he will also cross the hardy plants with one another; for he will argue that hardiness may depend on more than one constitutional factor, each of which may contribute to the property desired.

Wherefore some may survive by reason of their possession of one factor for hardiness, and others because they possess another factor. These separate factors may be brought together by mating the two plants with one another, and they may be obtained pure in a certain proportion of the descendants.

Despite the important practical results which have been obtained in acclimatation, no comprehensive experiments have ever been tried with the proclaimed object of determining whether adaptability or pre-existing constitution is the agent responsible for success in acclimatation. All we know is the fact, proved abundantly, in many countries and during many centuries, that the plants of certain climates may be introduced successfully into countries of very different climatic conditions.

Everyone is aware of the enormous number of plants which have been introduced from other parts of the world, and students of contemporary horticulture are impressed by the assiduity with which the United States, through its Department of Agriculture, is exploring the whole world with the object of introducing new plants for cultivation, and for hybridisation. Thus the 28th inventory (Bull. No. 248 of the *Bureau of Plant Industry*, 1912) contains records of 668 introductions from Chinese Turkestan, Mongolia, the Philippines, East Indies, British India, Hawaiian Islands, New Zealand, and South America. Included in this remarkable inventory are cold-resistant Alfalfas from Chinese Turkestan, a hardy wild Apple from the same region, winter Radishes for midsummer planting, four Mongolian wild Roses, a new species of Cotton, New Zealand Apples resistant to woolly aphis, and among a host of others the Narras (Acanthosicyos horrida), the thorny Cucurbit of the dunes around Walfisch Bay—a description of which we published recently.

To rival the activity displayed by the United States in introducing new plants, we must go back to the time of the Romans, whose services to horticulture are described by Gibbon in glowing periods, of which we quote those bearing on acclimatation:—

"Almost all the flowers, the herbs and the fruits that grow in our European gardens are of foreign extraction, which in many cases is betrayed even by their names.

"In the time of Homer the Vine grew wild in the island of Sicily, and most probably in the adjacent continent; but it was not improved by the skill, nor did it afford a liquor grateful to the taste of the savage inhabitants. A thousand years afterwards Italy could boast that, of the four score most generous and celebrated wines, more than two-thirds were produced from her soil. The blessing was soon communicated to the Narbonnese province of Gaul; but so intense was the cold to the north of the Cevennes, that in the time of Strabo it was thought impossible to ripen the Grapes in those parts of Gaul. This difficulty, however, was gradually vanquished, and there is some reason to believe that the vineyards of Burgundy are as old as the Antonines. The Olive in the western world followed the progress of peace, of which it was the symbol. Two centuries after the foundation of Rome, both Italy and Africa were strangers to that useful plant; it was naturalised in those countries, and at length carried into the heart of Spain and Gaul. The timid errors of the ancients that it required a certain degree of heat, and could only flourish in the neighbourhood of the sea, were insensibly exploded by industry and experience."

British Gardeners' Association.—A meeting of this association will be held at Lewis's Café, Station Road, Colwyn Bay, on the 11th inst., at 7.30 p.m. The chair will be taken by Mr. A. L. Statham, and the meeting will be addressed by the general secretary, Cyril Harding.

National Rose Society. — The annual general meeting of the National Rose Society will take place in the Holborn Restaurant, on Tuesday, the 17th inst., at 3 p.m. Proposals for the alteration of certain of the rules and regulations of the Society will be submitted by Mr. C. E. Shea and Mr. Walter Stevens. A conversazione will be held in the Crown Room from 4.30 to 6 p.m., to which all members are invited. Application for tickets must be made to the hon. secretary on or before Thursday, December 12, in order that suitable arrangements for refreshments may be made. The president will deliver a short address, and Dr. Geo. G. Hamilton will say a few words about "Roses and Some Bournemouth Gardens," illustrated by lantern slides in colour photography. The Society will hold a spring show on Thursday, May 1, 1913, in the Royal Horticultural Hall, Vincent Square, Westminster.

Royal International Horticultural Exhibition.—The directors of the Royal International Horticultural Exhibition, 1912, met at the Royal Horticultural Hall, Westminster, on the 26th ult., to consider a resolution for disposing of the property of the company, after payment of all debts and liabilities. The balance sheet showed a net profit of £2,870 3s. 7d. Allowing for payments which have still to be made, the balance may be taken as approximately £2,500. It was decided to disburse the profits in the following manner:—To the Irish Gardeners' Association and Benevolent Society, £100; towards the reprinting and bringing up to date of Dr. A. G. Pritzel's Botanical Index, £250. (To this latter purpose the R.H.S. have already promised to give £1,000.) The remainder of the profits (about £2,150) will be divided between the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund, in the proportion of two-thirds to the former institution and one-third to the latter. A second resolution was passed, namely "That the company be voluntarily wound up, and that Mr. G. J. Ingram be appointed liquidator." These resolutions are subject to confirmation at a later meeting.

Canterbury's New Mayor.—Mr. George Mount, the well-known rosarian, has been elected Mayor of the ancient borough of Canterbury. At the election ceremony which took place in the Guildhall Councillor Wood said that Mr. Mount's name was a household word, and that he was honoured and respected by everyone who knew him. A former Mayor of Canterbury, William Masters, was also a nurseryman, and he occupied the same nursery, and we believe that Mr. Mount lived in the same house for a time. William Masters was father of the late Dr. Maxwell T. Masters, who was Editor of the *Gardeners' Chronicle* for 41 years.

The Avocado Pear. - Under such alluring headings as "Where Meat Grows on Trees," the popular weekly periodicals draw attention to the fruit of Persea gratissima, claiming that it is "composed of all the substances which are to be found in meat." The facile pen of the writer credits this fruit with containing about 20 per cent. of fat and many other ingredients of great value, so that one "meat Pear is quite sufficient to make a meal for the average man." The natives of Mexico, he continues, live entirely on the Avocado, and, as experts have declared this fruit to be far superior to the Banana, and, in fact, the most valuable fruit known, it is hoped that with a sufficient supply of the trees the world may do away with meat entirely. But, lest the vegetarians should overwhelm the fruiterers with their orders, the concluding sentence informs them that the reason why the fruit is so little known at present is because it is grown nowhere on a large scale; what few trees there are grow around the huts of the natives, where they flourish with little care, and afford easy meals for the indolent owners. Other writers on tropical economic plants give the Avocado Pear a somewhat wider distribution, and state that, although originally confined to the West Indies, it is now grown in many tropical countries and is esteemed as a dessert fruit.

Potato Haulm as Food for Sheep.—Early in October experiments were made by Völtz, at the Institute of Fermentation Industries, Berlin, with Potato haulm, which was partially dried out-of-doors. After further drying in kilns, the haulm was chopped and given to two wethers, who ate it freely. The haulm was found to be more digestible when mixed with Hay.

The Potato Crop. - The Board of Agriculture and Fisheries estimates the total production of Potatos in England and Wales at nearly 2,244,000 tons, which represents, on an area of 463,000 acres, a yield of 4.85 tons per acre, the lowest since the returns of produce were first collected in 1884. The worst return previously was 4.97 tons per acre in 1900.

HOME CORRESPONDENCE

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

The R.H.S. Trials.—The latest *Journal* of the Royal Horticultural Society is to hand. It contains accounts of trials at Wisley, and a perusal of the Delphinium and Sweet Pea trials reminds us of a letter we addressed to the Secretary of the Society last year after reading the report of the Gladiolus trials. Our letter was simply acknowledged, and we would like to ventilate the matter in your columns. Of the Delphiniums reported on in the Wisley trials in 1912, at least 50 were raised in our nurseries, but of these 23 have the name of another nurseryman attached. Surely, this is extremely misleading and unfair to us as raisers and introducers of these varieties; for is it not generally understood that the name of a plant followed by the name of a firm or person signifies that the firm or person is the raiser or introducer? Under the present system, anyone can send other people's fine varieties, and get a most excellent but undeserved free advertisement for himself. We should have thought that when it is known the name of the raiser might be added in different type, and when it is not known it might be stated that the name of the person or firm attached was that of the sender only. *Kelway & Son.*

Frank Ashton Relief Fund. — A small committee of Orchidists has been formed to assist Mr. Frank Ashton, who has, unfortunately, fallen into indigent circumstances, and who is no longer able to follow his employment as a traveller in Orchids. He has been struggling against fate for the past two or three years, but has at last been compelled to give up owing to a very badly poisoned foot, to attacks of chronic rheumatism, and to an affection of the eyes. He is no longer able to travel, and his resources are practically at an end. An appeal is therefore made to all those who have been associated with Mr. Ashton in the Orchid business to show their practical sympathy with him in his great affliction by contributing towards a fund which will be utilised to establish him in some small home business. The committee of the Kew Guild (of which Mr. Ashton is a life member) have generously made a grant of £5 towards the fund. Further donations may be sent to the Secretary of the Kew Guild (Mr. Herbert Cowley, South Side, Kew Green), or to me, and will be gratefully acknowledged on Mr. Ashton's behalf. *John Weathers, 7, Talbot Road, Isleworth, Middlesex (Secretary).*

Bordeaux Spraying for Peach Curl (see p. 412).—This is a most destructive disease of Peach trees, as the foliage is rendered useless. I consider attacks of Peach curl are mostly due to low temperature, as I have never seen it on trees under glass; also it is not so prevalent in the southern districts as in the Midlands. At one time it was very troublesome here on wall trees outside, but persistent hand-picking early in the season, a thorough syringing with soft soap and quassia just before the flowers opened, and protecting the tender foliage have almost banished it. Protection from wind is afforded by double fish netting hung at a moderate distance from the trees and stretched tight across laths, so that it meets the top of the wall. I should hesitate to apply the Bordeaux mixture to Peach trees even in the resting stage, for an extra strong solution of Gishurst compound or similar substances has been known to cause severe bud-dropping, and the effects of the Bordeaux mixture would probably be worse. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

Hybrid Nomenclature (see p 413).—Mr. O'Brien says that I have cited the "earliest sub-committee on Orchid nomenclature." It was useless to cite the latest, which was appointed to deal with the special subject of the nomenclature of multi-generic hybrids. And what is the use of his citing the rules of a nomenclature congress that did not meet till after the *Orchid Stud Book* was published? The clause, "No one has a right to alter," &c., is only a saving clause under the section "Names that are to be rejected, dropped or modified," and is only intended to prevent the abuse of a very necessary rule. The names superseded in the *Orchid Stud Book* were neither regular nor correct, and their number is the measure of the neglect of recorders to observe existing rules. The remark concerning "self-constituted authorities" has no application to the *Orchid Stud Book*, for its authors adopted the Vienna rules, embodying them in a short and simplified wording. The Vienna rules say: "Hybrids.—The name, which is subject to the same rule as names of species, is distinguished by . . . . the sign × before the name. Ternary hybrids, or those of a higher (more complex) order, are designated like ordinary hybrids." Again, Mr. O'Brien says "the superseded names were in accordance with the rules, and had the authority of the Paris Nomenclature Conference." I have the said rules before me, but cannot find anything to support this statement. If a "changed name" becomes a "new name"—and the point is not contested—that is an additional reason why the names chosen should be in correct form at the outset. Mr. O'Brien says "Cattleya John Jones," not "C. Jonesii," is the better way. Then why did he give such names as Cypripedium Clinkaberryanum, Lælio-Cattleya Brymeriana, Dendrobium Owenianum, and many others? There were already the precedents Lælio-Cattleya Aurora, Cassandra, Proserpine, Stella, Zenobia, &c., &c. One would never dream from Mr. O'Brien's remarks that I have given scores of others. They are admirable, but their use does not exclude such names as Calanthe Dominyi, Veitchii, &c. It is not necessary to follow Mr. O'Brien further. He was a member of the committee which drew up the rules, the neglect of which has necessitated so many names being "rejected, dropped, or modified." He now censures those who attempted to carry them into practice. It is deplorable. *R. A. Rolfe.*

Wart Disease of Potatos.—A few remarks may be made in reply to Mr. Taylor, whose interesting note appeared on November 23, p. 391. It may safely be said that drastic steps are being taken to eradicate this disease in England, and many notices prohibiting the planting of Potatos other than immune or resistant varieties in infected ground have been served. It does not, however, seem reasonable to suggest the prohibition of the importation of Potatos, which are a necessary foodstuff. The disease is too widespread in Britain for such a step to serve a useful purpose, and the inspection of imported Potatos is not feasible. Further, while foreign Potatos are usually only imported for consumption, wart disease is unlikely to be introduced with them, since foreign countries appear to be comparatively free from it. There does not appear to be the slightest evidence that wart disease originally came from the Continent, though it was reported from Hungary in 1896; it was more or less prevalent 30 years ago in out-of-the-way parts of Cheshire, if not scientifically recorded until 1902 by my friend, Mr. J. W. Eastham, B.Sc. The last two lines of Mr. Taylor's letter exhibit the fallacy of arguing from local conditions. Midlothian is believed to be comparatively free from wart disease, but if Mr. Taylor will but cross to Fife he may find whole villages with scarcely a garden but what is badly infested with it. *H. C. Long.*

Sterilising Soil.—In view of Mr. Stevenson's remarks at the Chrysanthemum Conference about sterilising soil by heat for Chrysanthemums (see p. 417), I venture to give my experience with Begonia Gloire de Lorraine. In 1911 I lost a large number of plants through eelworm. This season I sterilised all the soil in which a large number of plants were grown from the cutting stage onwards with good results as regards destroying eelworm. The plants grew freely, but always appeared drawn and leggy, and although they made very large specimens were deficient, in size of bloom, colour, and substance. A few plants grown in soil that had not been treated were not so tall, but more compact in habit, better coloured, whilst the blooms were large and of great substance. Has any reader had a similar experience? *E. R. James.*

SOCIETIES.

ROYAL HORTICULTURAL.

December 3.—In view of the Perpetual-flowering Carnation Society's exhibition, on Wednesday, in the same Hall, many growers of these flowers took the opportunity of exhibiting Carnations at the R.H.S. meeting, the groups remaining for the following day. The Floral Committee awarded a Gold Medal for a collection of these flowers shown by Mr. Engelmann. There were fewer exhibits of Chrysanthemums than at recent meetings, but Begonias were again a prominent feature. The Floral Committee recommended seven Awards of Merit. Plenty of space was available for miscellaneous exhibits, including paintings of floral subjects, horticultural sundries and preserves. The Orchid Committee recommended two First-class Certificates and three Awards of Merit.

The Fruit and Vegetable Committee awarded two Gold Medals, one for a collection of bottled fruits, the other for Apples shown by the Government of British Columbia. Three new Apples received Awards of Merit. At the three o'clock meeting in the lecture room a paper on "The Vegetation of the Islands of Lake Maggiore," by Mme. Tzikos St. Leger, was read by the secretary.

Floral Committee.

Present: Henry B. May, Esq. (in the Chair); Messrs. C. T. Druery, John Green, W. J. Bean, G. Reuthe, J. W. Barr, Wm. Howe, J. F. McLeod, John Dickson, Chas. Dixon, H. J. Jones, Arthur Turner, Chas. E. Shea, J. T. Bennett-Pöe, E. H. Jenkins, W. J. James, Chas. E. Pearson, E. A. Bowles, F. Page Roberts, Jas. Hudson, C. R. Fielder, C. Blick, R. C. Reginald Nevill, John Jennings, W. Cuthbertson, and W. P. Thomson.

Messrs. W. Cutbush & Son, Highgate, exhibited forced plants from retarded stock; a number of pretty dwarf Roses of the polyantha section; Daphne indica rubra; Ericas in variety, the best of these being E. gracilis; and varieties of Begonia. As a separate exhibit this firm staged a collection of Carnations of the perpetual-blooming type. (Silver-gilt Banksian Medal.)

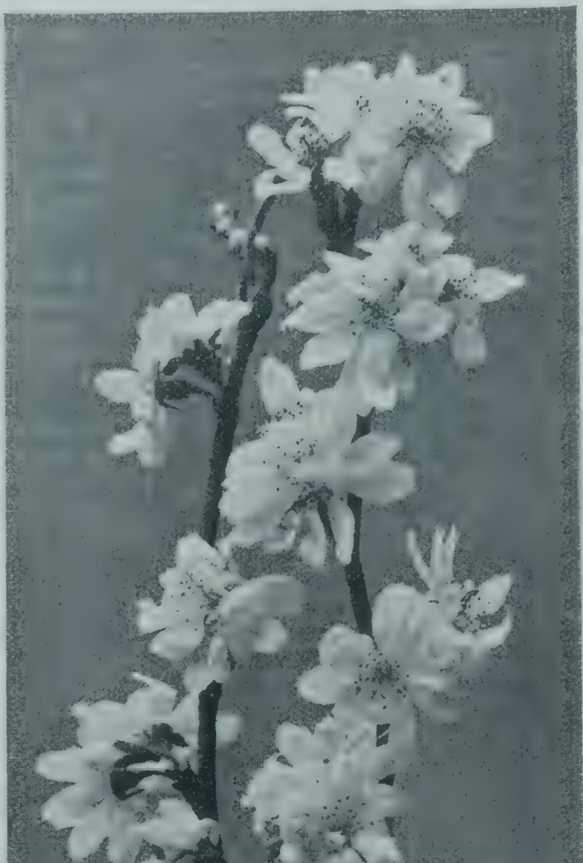

Fig. 186.—prunus miqueliana: flowers white.

(R.H.S. Award of Merit on Tuesday last.)

Messrs. James Veitch & Sons, Ltd., King's Road, Chelsea, showed several fine winter-flowering Begonias; a group of Bouvardia Humboldtii corymbiflora (white); B. Dazzler (scarlet); a collection of Indian Azaleas; and small pot-plants of Chrysanthemums. Begonia Julius has small, double flowers of salmon-pink colour; it is an excellent variety for growing in baskets. (Silver Flora Medal.)

Messrs. H. B. May & Sons, Edmonton, filled a table with miscellaneous flowering plants and Ferns, for which a Bronze Flora Medal was awarded.

Mr. C. Lange, Hampton, showed plants of Hydrangea Mme. Emile Mouillère with remarkably large inflorescences; varieties of Carnations; and a large batch of Begonia Glory of Cincinnati. (Silver Flora Medal.)

Mr. L. R. Russell, Richmond, Surrey, showed numerous well-flowered plants of Indian Azaleas, a collection of ornamental and berried shrubs, and a few plants of Anœctochilus, including the rare A. (Goodyera) Pollissonii. (Silver Flora Medal.)

Messrs. H. Cannell & Sons, Swanley, made a bright display with Zonal Pelargoniums. The following are new varieties:—Sensation (rich red), W. Pfitzer (orange scarlet), Borneman's Best (rose magenta), and Mrs. F. Seares (palest pink).

Well grown Cyclamens were shown by Rev. Henry Buckston, Sutton Hall, Derby. Many varieties had frilled petals, and these were very pretty in the bud stage. Victoria Buckstone is a fine white variety of this type. (Silver Banksian Medal.)

Messrs. Stuart Low & Co., Enfield, contributed a very pretty exhibit of Carnations. A prominent place in the centre was afforded their fine Baroness de Brienen variety (salmon-pink); at the back were hanging baskets filled with pink and white varieties, whilst in the foreground the new Rosette of bright pink colour showed to advantage. Satin Robe is a new variety of silver pink colour, an improvement on Winsor. (Silver Flora Medal.)

Mr. C. Engelmann, Saffron Walden, was awarded a Gold Medal for an exhibit of Carnations. The varieties and seedlings numbered 100, the collection being the finest in the Hall. Amongst novelties we noticed Fanny (a fancy with scarlet markings on a pink ground), My Rose (cerise), Lucy (pink), Golden Ray (yellow), and two sports of Carola (one with a rose ground marked with crimson, the other with scarlet petals).

Messrs. Allwood Bros., Haywards Heath, exhibited Carnations of exceptional quality. The new varieties Salmon Enchantress and Mary Allwood appeared to advantage.

Exhibits of Carnations were also staged by Mr. W. Lawrenson, Yarm-on-Tees (Silver Banksian Medal); Mr. H. Burnett, Guernsey (Silver-gilt Flora Medal); Messrs. Young & Co., Hatherley (Silver Banksian Medal); and Misses G. C. Price & A. B. Fyfe, Grove Park Nursery, Lee.

Col. Frank M. Lockwood, M.P., Bishop's Hall, Romford, Essex (gr. Mr. G. Craddock), showed numerous well-grown plants of the white Japanese Chrysanthemum Mrs. Swinburne. (Cultural Commendation and Silver Flora Medal.)

Manor House Nurseries, Cardiff, showed single Chrysanthemums. Audrey (yellow), Caledonia (pink), and Doris Chaplin (pink, with a zone of white around the bold, yellow disc) are three of the choicer varieties in this collection.

Messrs. Godfrey & Son, Exmouth, Devonshire, showed the fine white Anemone-flowered Chrysanthemum Godfrey's Perfection, which received an Award of Merit on November 21, 1911.

Messrs. W. Wells & Co., Merstham, Surrey, staged Chrysanthemums in variety, for which a Silver Banksian Medal was awarded.

Messrs. John Peed & Son, Norwood, exhibited a large group of Begonias of the Gloire de Lorraine type.

Messrs. Barrie & Brown, King William Street, London, showed Ericas and Begonias.

Mr. Clarence Elliott, Stevenage, exhibited a small rockery planted with Alpines and dwarf Conifers. There were numerous rare Saxifrages, also a fine batch of Gentiana acaulis in bloom. The Conifers included plants 6 to 9 inches high of Pinus sylvestris globosa, also small plants of Juniperus Sabina tamariscifolia, and Abies Remontii.

Messrs. Whitelegg & Page, Chislehurst, showed a large number of Alpines in pots and pans, and similar exhibits were staged by Messrs. T. S. Ware, Ltd., Feltham (Silver Banksian Medal), and Mr. G. Reuthe, Keston, Kent, who also showed Nerines.

Miss Malone, 111, Cheyne Walk, Chelsea, exhibited a selection of her oil paintings, which are in the modern French landscape style. When viewed from the proper distance, these representations of gardens and woodlands are exceedingly effective. The garden at "The Master's" Lodge, St. John's College, Cambridge, "My Lady's Garden" on the terrace at Wrest Park, La Rosarie de la Haije, and "Poppies" are the titles of a few of the striking paintings which were on view.

Awards of Merit.

Asplenium divaricatum elegans.—A graceful Fern with fronds divided into fine linear segments. The habit is open and the fronds are feathery, not plumose or crested. The almost black stems give an added effect to the pale-green foliage. The plants exhibited were a foot high in 3-inch pots. (Shown by Messrs. J. J. Parker & Co., Whetstone.)

Chrysanthemum Miss A. Brooker (decorative or small Japanese of the new classification).—A handsome variety for decorative purposes and suitable for market. The colour is a light chestnut (the deepest shade of blood-red of the *Rép. de Couleurs*), and the petals incurve, showing a bronze reverse. (Shown by Messrs. J. Veitch & Sons and Messrs. W. Wells & Co.)

C. "*Eric Wild*" (single).—A neat flower possessing two or three rows of smooth, flat petals. The colour is a pale mauve-pink, with a narrow, not very distinct band of white surrounding the disc. (Shown by Messrs. W. Wells & Co.)

C. Mrs. Wingfield Miller (single).—A handsome flower less formal in the arrangement of the petals, which are in three or four rows, than the last variety, and distinct in keeping slightly cup-shaped when fully developed instead of opening flat. The colour is a purplish-rose, a little darker than shade four of violet-rose of the *Rép. de Couleurs*, and the disc is banded with a clear, white ring about an eighth of an inch in width. (Shown by Messrs. Wells, Merstham.)

Prunus Miqueliana (see fig. 186).—A Japanese species allied to subhirtella. The flowering sprays exhibited had pale-brown, twiggy growths, from each node of which sprang close clusters of three or four short-pedicelled flowers. The flowers are white, but with age the numerous filaments become pink and give a flushing of pink to the spray; they are about ¾ inch in diameter, and have about 15 small lance-shaped petals. Nicholson *(Dictionary of Gardening)* describes the plant as having deeply and irregularly-cut leaves and sparsely-hairy pedicels and calyces. The leaves had already fallen from the sprays exhibited, and although there was a slight pubescence on some twigs, the calyces and pedicels appeared to be quite glabrous. A very pretty, low-growing tree, which in Sussex flowers regularly in November and December. It requires a sharp frost to destroy the expanded flowers, and the buds are seldom injured. (Shown by Col. Stephenson R. Clarke, C.B., Borde Hill, Cuckfield—gr. Mr. Conn.)

Carnation Mrs. A. F. Dutton (see fig. 187).—A sport from White Perfection. The stem and calyx are excellent, but the blooms are scarcely scented. The colour is a very bright rose (shade four *Rép. de Couleurs*), but pales towards the edge of the petals. (Shown by Mr. A. F. Dutton.)

C. Bonfire.—A rather small-flowered, perpetual-flowering variety, but exceedingly neat and pretty, with excellent stiff stems and sound calyx. The petal edge is serrated, and the flowers are not scented. The colour is a very bright scarlet. (Shown by Messrs. W. Wells & Sons.)

Cultural Commendation.

Chrysanthemum Mrs. Swinburne. A large batch of this fine white Chrysanthemum was shown; the plants were grown in 5-inch pots. One specimen bore 11 large, disbudded flowers and one unopened bud, the whole plant being only 2 feet high. (Shown by Col. Lockwood, Bishop's Hall, Romford—gr. Mr. G. Craddock.)

Some Further Novelties.

Winter-flowering Begonia Duchess of Westminster, shown by Messrs. Clibrans, is a good addition to the varieties exhibited at the last meeting. The flowers are double, and a bright shade of deep rose-pink.

Carnation Northport, a variety that has received extraordinary praise in America, was shown by Messrs. Wells. The colour is an intense cerise-pink.

Messrs. R. Wallace & Co. showed Iris Vartanii White Pearl. This is an albino form of the type, but retains the distinct yellow ridge on the claw of the falls. The type was named by the late Sir Michael Foster after Dr. Vartan, of Nazareth, who first sent it to him. It is the earliest to flower of the reticulata group, being out normally from October-December, and considerably in advance of Histrio, and is figured in the *Bot. Mag.*, 6,942. White Pearl was imported from Palestine in 1910 as a white form of I. histrioides, and has been distributed under that name. It has also been sent out as a white Histrio, but it is quite distinct from these species. It is a pretty little species with almond-scented flowers, and owing to the character of our November weather, they generally require the protection of an Alpine house.

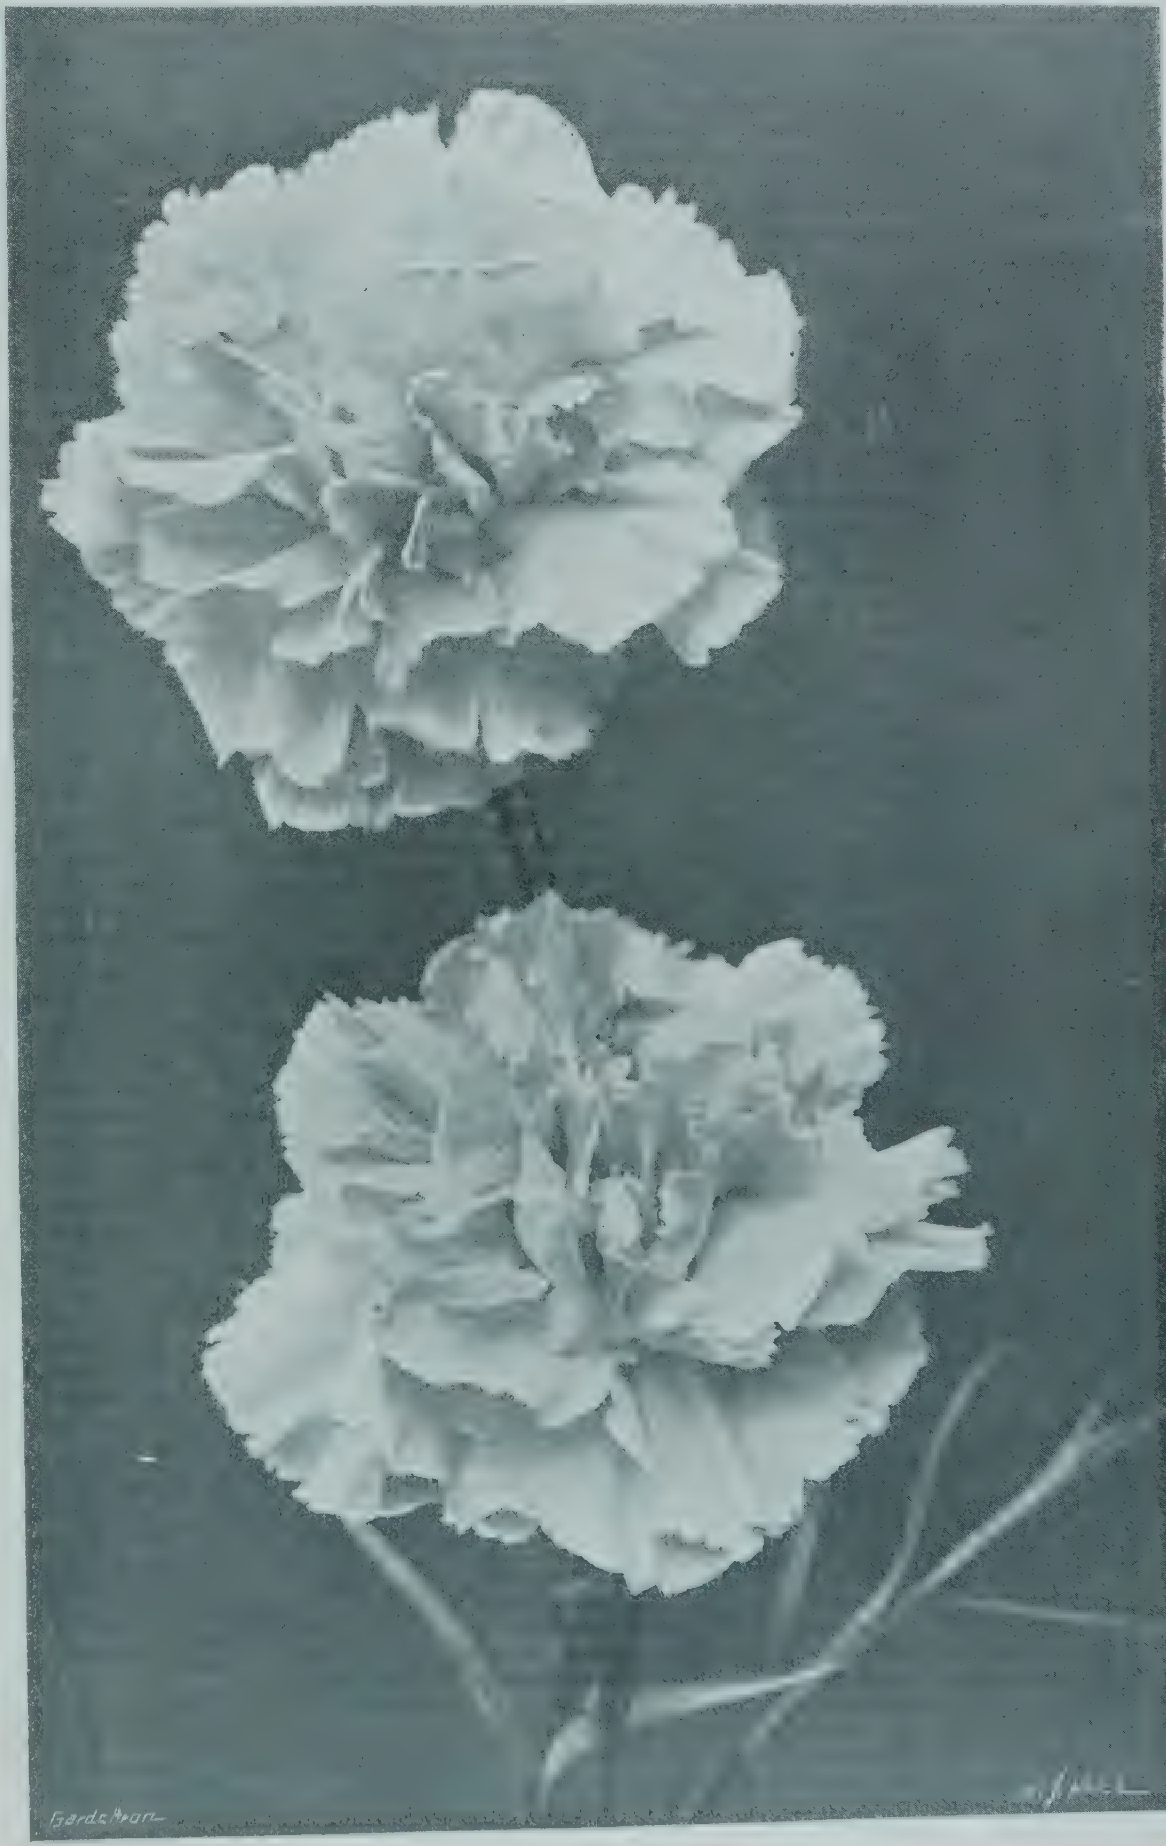

Fig. 187.—Carnation Mrs. A. F. Dutton: colour, bright rose.
(R.H.S. Award of Merit on Tuesday last.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); Messrs. Jas. O'Brien (hon. sec.), J. S. Moss, Gurney Wilson, J. Wilson Potter, R. G. Thwaites, F. Sander, R. A. Rolfe, T. Armstrong, A. McBean, C. H. Curtis, W. Cobb, J. Charlesworth, J. Cypher, W. H. Hatcher, J. E. Shill, H. G. Alexander, A. Dye, W. P. Bound, W. Bolton, de B. Crawshay, Sir Jeremiah Colman, Bart, and Sir Harry J. Veitch.

Lieut.-Col. Sir George L. Holford, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander), showed the unique Vanda cœrulea Sanderæ with two spikes of perfectly-shaped flowers differing from all other forms in colour, the tint being clear magenta pink with no trace of blue. It was awarded a First-class Certificate, November 22, 1910, when first shown. Also Cypripedium × Nydia (Niobe ×

nitens-Leeanum), a fine flower, and two others. (See Awards.)

Messrs. Jas. Veitch & Sons, Chelsea, staged a good group, for which a Silver Flora Medal was awarded. An interesting feature of this exhibit was a batch of seedlings between Zygopetalum Mackayi and Odontoglossum crispum, the flowers differing in no way from the Z. Mackayi staged at each end of the group. The peculiarity has been frequently noted, but the facilities for comparison made the exhibit very interesting. A fine lot of Cypripediums included C. Idnia (insigne Harefield Hall × Countess of Carnarvon), a large flower of the Æson giganteum class; C. Glebelands "Veitch's variety"; C. Gaston Bultel; good forms of C. Leeanum, and some promising unnamed hybrids. Others noted were Brasso-Lælio-Cattleya Morna (B.-C. Mme. Chas. Maron × L.-C. bletchleyensis), a bold flower of a light rose-pink tint, and several bright Lælio-Cattleyas.

Messrs. Sander & Sons, St. Albans, staged an effective and interesting group, containing several novelties. The best were Cypripedium St. André (Leeanum A. Lefebvre × Actæus Bruggense), a fine flower, with a large, pure-white dorsal sepal, having an emerald-green base, with some small, dark spots and a distinct purple medium line: petals and lip pale green, tinged with purple; C. Conquest (Earl of Tankerville × Leeanum Clinkaberryanum), much larger than Earl of Tankerville, but similarly coloured; and C. Smaragdina (Euryades Leopardianum × Ville de Paris), a model flower with a clear gamboge-yellow ground, beautifully blotched with chocolate purple. A very interesting plant was Chondropetalum Fletcheri, which had Chondrorhynca Chestertonii for seed-bearer, and which showed conclusively the correctness of the record. Lælio-Cattleya Golden Oriole, and other showy Lælio-Cattleyas, and some interesting species were also shown.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), was given an Award of Merit for a varied group, the front of which was of the yellow Cypripedium insigne Sanderæ, C. insigne Harefield Hall and Bohnhoffianum, varieties of C. Leeanum, C. Pittianum, &c. Among the Odontoglossums, O. ardentissimum "Pitt's variety," raised at Rosslyn, was a very pretty and richly-coloured form. Various other hybrid Odontoglossums and several Cattleya Clarkæ, Dendrobium Phalænopsis, Chondropetalum Fletcherianum, and Maxillaria Hubschii were also noted.

Messrs. J. Cypher & Sons, Cheltenham, secured a Silver Banksian Medal for a representative group of Cypripediums, which included many fine forms. With them were Zygopetalum crinitum, Lælia anceps Schröderæ (of very dark colour), Lælio-Cattleya Rubens (large and of fine shape), and Cattleyas.

Messrs. W. Baylor Hartland & Sons, Cork, were awarded a Silver Banksian Medal for a group of Cypripediums and hybrid Odontoglossums. Very effective was Cypripedium insigne Sanderæ. Odontoglossum Groganiæ bore a finely branched spike of rose-purple flowers, and among Cattleyas we noted a very distinct home-raised C. Hardyana, C. aurea being the seed-bearer. The sepals and petals were creamy-yellow, slightly flecked with rose, the lip rose-purple with gold veining.

Messrs. J. & A. McBean, Cooksbridge, staged an effective group, in which were their new Cymbidium Doris and a very fine form of C. Wiganianum. Several dark hybrid Odontoglossums, O. Phœbe, three of their seedling Cattleya aurensis, and some good Cypripediums were also exhibited.

Messrs. Charlesworth & Co., Haywards Heath, staged a small group, in the centre of which was a magnificent specimen of Angræcum sesquipedale with ten of its large, wax-like flowers. Various good Cypripediums, scarlet Odontiodas, and the beautiful new Sophro-Lælio-Cattleya Carna (see Awards) were also included.

Messrs. Hassall & Co., Southgate, staged a selection of Cypripediums and Cattleya and Lælia hybrids. Also Vanda suavis and other Orchids.

E. H. Davidson, Esq., Orchid Dene, Twyford, showed a remarkably pretty hybrid between Lælio-Cattleya Gottoiana and Cattleya Dowiana aurea, the flowers resembling the latter in fine shape, but with the petals more openly displayed Sepals and petals primrose yellow, freckled at the tips with rose. Lip rosy-carmine with gold veining.

His Grace the Duke of Marlborough, Blenheim Palace (gr. Mr. Hunter), sent Cypripedium Beatrice (aureum Hyeanum × Memoria Jerninghamiæ) with a white dorsal sepal.

J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed the fine Cypripedium Leeanum J. Gurney Fowler; a fine Odontoglossum Lambeauianum with a branched spike of many flowers; and Odontioda Latona.

Messrs. Swan & Price, Keyfield Nursery, St. Albans, sent Cypripedium Maurice, a good flower of unrecorded parentage.

Messrs. Stuart Low & Co., Bush Hill Park, showed Cypripedium Eva (aureum Hyeanum × Memoria Jerninghamiæ).

AWARDS.

First-class Certificate.

Lælio-Cattleya Golden Oriole "var. Ruby" (L.-C. Charlesworthii × C. Dowiana aurea), from Lieut.-Col. Sir George L. Holford, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—A very handsome flower, totally different in colour to the original form. The petals and lip are of a rich claret-red colour, delicately viened with yellow; the sepals have a yellow ground tinged and blotched with claret-red. Unless closely examined, the flower appears to be almost entirely claret-red.

Odontioda Latona "Fowler's variety" (Odontioda Bradshawiæ × Odontoglossum crispo-Harryanum), from J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis). —A very fine hybrid with flowers equal in size to O. crispum and richly blotched. The ground colour is white, the sepals and petals having a broad rose margin, the inner parts heavily blotched with reddish mauve. The front of the lip is white and the crest yellow, with a large reddish blotch.

Award of Merit.

Cypripedium Viking (Buchanianum × illustre), from Lieut.-Col. Sir Geo. L. Holford, K.C.V.O. (gr. Mr. H. G. Alexander).—This beautiful hybrid has the fine substance of C. Druryi and its wax-like, dorsal sepal, which is pure white with an ovate violet-purple band up the centre. Petals and lip Indian yellow tinged with brown.

Sophro-Lælio-Cattleya Carna (L.-C. Cappei × S.-L. heatonensis), from Messrs. Charlesworth & Co.—A beautiful flower of large size and of a bright magenta-rose colour with yellow base to the lip.

Cypripedium Eurybiades (Euryades × Alcibiades), from Sir Trevor Lawrence, Bart., K.C.V.O., Burford (gr. Mr. W. H. White).—An improvement on C. Euryades. Flower large. Dorsal sepal pure white above, emerald green below; evenly spotted with dark purple. Lip and petals yellowish-tinged dark purple.

Cultural Commendation.

To Mr. W. H. White, Orchid grower to Sir Trevor Lawrence, Bart., for a fine specimen of Sigmatostalix radicans with many spikes.

Fruit and Vegetable Committee.

Present: George Bunyard, Esq. (in the Chair); Messrs. Jos. Cheal, W. Bates, Edwin Beckett, F. Perkins, Geo. Kelf, H. Markham, A. R. Allan, A. W. Metcalfe, J. Davis, A. Bullock, J. Jaques, Geo. Wythes, A. Grubb, and Owen Thomas.

Messrs. J. Cheal & Sons, Crawley, were awarded a Silver Banksian Medal for an exhibit of Apples and Pears. The new variety Crawley Beauty was represented by several baskets of fine fruits. Encore, a comparatively new variety, is an excellent late culinary Apple; one of the fruits weighed 1 lb. 7¼ ounces. There was a good dish of the new Pear Beurré de Naghan.

The most imposing exhibit of fruit was shown by the Government of British Columbia. It consisted entirely of Apples, mostly in boxes, as shipped for the English market. The fruits were superb, and the Committee selected the variety Winter Banana as worthy of an Award of Merit. Spitzenberg (a solid red Apple of fine flavour), Grime's Golden, Winesap, Rome Beauty, Wagner, Canadian Baldwin, Canada Red, Newtown Pippin, and Cox's Orange Pippin represent the pick of the varieties. (Gold Medal.)

A Gold Medal was awarded to Mrs. W. Banks, Park Street, Westminster, for a collection of preserves. It was the finest exhibit of this nature ever seen at these meetings, and comprised 168 distinct kinds of bottled vegetables and fruits. As showing the comprehensive nature of this exhibit, we may enumerate Mushrooms, Chutneys, Mulberries, Loganberries, Apricots, Quince jelly, Carrots, Peas, Celery, Beans, and Currants. The exhibitor informed us that the Mulberries and Loganberries are especially delicious, and that Currants are the most difficult to preserve whole. Some of the vegetables were bottled in sterilised salt water.

Silver Knightian Medals were awarded to Mrs. Miller, Moylem, for preserves, and Messrs. Westmacott, for South African produce.

A Silver Banksian Medal was awarded to Miss Hilda, Harcourt Terrace, Kensington, for preserves. A Bronze Banksian Medal was awarded to Mr. D. E. Tower, Pershore, for a similar exhibit.

Awards of Merit.

Apple Crawley Beauty.—A late culinary variety, about 2¾ inches deep; richly coloured on the side next to the sun, and prominently streaked with red at the base. The parentage is unknown. Messrs. Cheal & Son, the exhibitors, informed us that it is a local variety found in many cottagers' gardens in the neighbourhood of Crawley. The fruits hang very late in the season, often after the leaves have fallen.

Apple Winter Banana.—A solid fruit, 3 inches deep and 4½ inches in circumference, of pale-yellow colour flushed with red. The flesh is juicy, sweet, and of fine flavour. Shown by the Government of British Columbia.

Apple Steyne Seedling.—This Apple resembles a large fruit of Cox's Orange Pippin. It is of excellent eating quality, and is a fine addition to late dessert varieties. Shown by Lady Thornycroft.

THE LECTURE.

Mme. Tzikos St. Leger's paper was read by the secretary. The title, "The Vegetation of the Islands of St. Leger in Lake Maggiore," was rather a misnomer, but if any of the large audience attended in the expectation of hearing an account of the indigenous vegetation of these islands, they must have been agreeably surprised when the story so interestingly unfolded proved to be an account of the work performed by Mme. St. Leger, who transformed the rocky, windswept and almost desert island on which she has made her home into a beautiful and interesting garden. It seems that when Mme. St. Leger acquired the island it contained a disused nunnery, of which only the strong outer walls were sound, one tall Lime tree, which had been a landmark for years, and a few stunted Oaks, which eked out a precarious existence drawn from the scanty nourishment found between the crevices of rocks. This was practically the extent of its vegetation. The long, narrow Lake Maggiore is situated partly in Northern Italy and partly in Switzerland. The imaginary line across the lake, which divides it, is so rigidly respected that any yacht crossing it is hailed from the Customs vessel and inspected. The two St. Leger islands are about two miles from the Italian shore, and enjoy a delightful climate during the hot season; when the dwellers on the mainland are oppressed by heat, the temperature on the St. Leger islands, thanks to the surrounding water, rarely rises above 70° Fahr., whilst during the winter months the minimum of 15° Fahr. is rarely reached. This equable climate renders possible the diverse and almost tropical vegetation which Mme. St. Leger has introduced. As there was practically no soil on the island, enormous quantities had to be brought from the mainland in boats, and before any planting was commenced the nunnery was put into habitable condition and garden paths were made.

The lantern slides illustrated the great amount of success which has attended the gardening operations. As the lecture progressed, the bare, rocky expanses, with their few stunted trees and weeds, gave place to charming views of Palms (Chamærops excelsa), with tall, straight stems, crowned with leaves and fruits, contrasting with dark-green, upright Roman Cypresses (Cupressus sempervirens) or with the long leaves of the Japanese Banana (Musa japonica, syn. M. Basjoo) which border the paths. Mention was made of such rare and interesting Conifers as Pinus longifolia, Cupressus majestica (C. torulosa var. majestica), Picea Morinda, Araucaria Bidwillii, Cupressus torulosa, Ginkgo biloba, and a "Retinospora," with to the *Kew Hand-list* or the *Manual of Coniferæ*, but which had the characteristic appearance of Dacrydium Franklinii. The lantern slides of Eucalyptus amygdalina, with tall, straight, silvery trunks; an exceedingly fine Date Palm (Phœnix dactylifera); a Cycas revoluta; and a large Tangerine Orange bush, which bears abundant crops of fruit, evoked great admiration.

On the north side of the island a row of Weeping Willows, planted partly as a protection from the rough winds, encircle rarer trees, and one result of importing soil is that Poplars and Maples now grow wild amongst them.

Roses, in groups and in the borders, bear a profusion of blossoms; the variety Maréchal Niel was in flower last Christmas Day, and Laurette de Messimy bloomed in February.

A kitchen garden was made, and 3 feet of pure sand, treated with suitable manure, produced satisfactory crops of Cauliflowers, Potatos, and other vegetables.

GHENT HORTICULTURAL.

November 3.—The monthly meeting of the Chambre Syndicale des Horticulteurs Belges et Société Royale d'Agriculture et de Botanique de Gand was held on the above date, and the following awards were made.

Certificates of Merit.

Cypripedium insigne var. perfectum; Odontonia Firminii (Odontoglossum crispum × Miltonia vexillaria); Cypripedium Bruggense; and *C. Durandii*, shown by Monsieur F. Lambeau.

Cattleya St. Anne; C. Venus var. lutescens; C. Fabia alba; Cypripedium Memnon; C. elatior; C. Priam; C. Gaston Bultel; Lælio-Cattleya Bulgaria; and *Masdevallia Bella*, shown by Monsieur Jos. de Hemptinne.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

November 7.—*Committee present:* Rev. J. Crombleholme (in the Chair); Messrs. R. Ashworth, J. Cypher, J. Evans, A. Hanmer, Dr. Hartley, W. Holmes, A. J. Keeling, J. Lupton, D. McLeod, H. Thorp, Z. A. Ward, A. Warburton, and H. Arthur (secretary).

A Silver-gilt Medal was awarded to A. Warburton, Esq., Haslingden (gr. Mr. Dalgleish), who staged a miscellaneous group.

Large Silver Medals to Z. A. Ward, Esq., Northenden (gr. Mr. Weatherby), for a group of Cypripediums and Odontoglossums; and Messrs. Sander & Sons, St. Albans, for a choice group.

Silver Medals to Col. J. Rutherford, M.P., Blackburn (gr. Mr. Lupton), for Cattleyas in variety; Rev. J. Crombleholme, Clayton-le-Moors (gr. Mr. Marshall), who staged a group of Cypripediums; J. McCartney, Esq., Bolton (gr. Mr. Holmes), for Cattleyas and hybrids; Messrs. J. Cypher & Sons, Cheltenham, for Cattleyas and Cypripediums; and Messrs. A. J. Keeling & Sons, Bradford, for Cattleyas.

Other exhibitors included O. O. Wrigley, Esq., Bury (gr. Mr. Rogers); R. Ashworth, Esq., Newchurch (gr. Mr. Gilden); F. A. Hindley, Esq., Great Horton, Bradford; Mr. W. Shackleton, Great Horton; and Mr. W. Birchenall, Alderley Edge.

AWARDS.

First-class Certificates.

Cattleya Iris variety Ashworthiæ.—A large, round flower, of good colour, with deeply-coloured lip, exhibited by R. Ashworth, Esq.

Cypripedium "Jasper" (Alcibiades × Hitchensæ).—A well-formed flower; the dorsal petal has a white margin. From Z. A. Ward, Esq.

C. Hassallii "Hindley's variety" (Charlesworthii × bingleyense).—From F. A. Hindley, Esq.

Award of Merit.

Odontoglossum crispum variety Arthur.—A hybrid of unknown parentage. Shown by Z. A. Ward, Esq.

At the meeting held on November 14 the following members of the committee were present: Rev. J. Crombleholme (in the Chair); Messrs. R. Ashworth, J. Cypher, J. Evans, W. Holmes, J. Lupton, C. Parker, H. Thorp, Z. A. Ward, and H. Arthur (secretary).

Gold Medals were awarded to W. R. Lee, Esq., Heywood (gr. Mr. Branch), for Cypripediums; Col. J. Rutherford, M.P., Blackburn (gr. Mr. Lupton), and Messrs. J. Cypher & Sons, Cheltenham, for a fine display of Cypripediums and Cattleyas.

Silver-gilt Medals to Mrs. A. K. Wood, Glossop (gr. Mr. Gould), for a pleasing display of Cattleyas and Lælio-Cattleyas in variety; A. Warburton, Esq., Haslingden (gr. Mr. Dalgleish), for a fine group; and Messrs. Charlesworth & Co., Haywards Heath, for a choice mixed group.

Large Silver Medal to R. Ashworth, Esq., Newchurch (gr. Mr. Gilden), for a miscellaneous collection.

Silver Medals to Rev. J. Crombleholme, Clayton-le-Moors (gr. Mr. Marshall), for a small group of Cypripediums; and J. McCartley, Esq., Bolton (gr. Mr. Holmes).

Other exhibitors included Messrs. A. J. Keeling & Sons, Bradford, and Mr. J. Evans, Congleton.

AWARDS.

First-class Certificate.

Cattleya labiata "Cyme."—A large, well-set flower, of pure white-sepals and petals, with faint colour in lip. From Col. J. Rutherford.

Awards of Merit.

C. labiata "Vestalis," Cypripedium Actæus "Ashlandense No. 2," and *C. insigne Rossendale (Sanderæ × Laura Kimball),* all from R. Ashworth, Esq.

Cultural Certificates

were granted to Mr. Gilden for a fine example of *Cattleya Portia*, and to Mr. Gould for a good specimen of *Vanda cærulea.*

WESTON-SUPER-MARE AND DISTRICT CHRYSANTHEMUM.

November 7.—The 26th exhibition of this society was held on this date at Knightstone Pavilion.

In the class for a group of Chrysanthemums, in a space of 50 square feet, a magnificent group exhibited by Frank E. Dove, Esq., Chandos Lodge (gr. Mr. G. Henley), was awarded the 1st prize; 2nd, Mr. Cornellius (gr. Mr. C. Cook).

For a group of miscellaneous plants arranged for effect Mr. C. J. Ellis, Weston Nurseries, Weston-super-Mare, won the 1st prize easily with a beautifully-arranged group containing finely-coloured Crotons, Poinsettias, Liliums, Cattleyas, and Oncidiums; 2nd, Mr. W. Brooks, Whitecross Nurseries.

In the class for 24 blooms of Japanese Chrysanthemums there was not a weak bloom in the whole of the exhibits. The 1st prize was won by H. E. Murry, Esq., Anderdon, Taunton (gr. Mr. J. Bishop); 2nd, Hugh Andrews, Esq., Wickwar (gr. Mr. J. H. Tooley). For 12 Japanese blooms the 1st prize was won by Frank Dove, Esq. (gr. Mr. G. Henley).

Exceptionally fine flowers were shown in the class for six Japanese blooms; the 1st prize was won by E. E. Baker, Esq., Weston-super-Mare (gr. Mr. H. Whitehead); 2nd, Mrs. W. S. Balliscombe, Worle.

HITCHIN CHRYSANTHEMUM.

November 14.—This show was a great success. The principal prize was offered for the best exhibit of six vases of Japanese blooms in six varieties. There were five competitors, and John Balfour, Esq. (gr. Mr. A. Jefferies), won easily with grand blooms of the varieties William Turner, Mrs. G. Drabble, Lady Talbot, F. S. Vallis, Fred Green, and John Peed. 2nd, Bailey Hawkins, Esq., Stagenhoe Park, Welwyn (gr. Mr. E. Kinns). Mr. Balfour was successful in the class for 12 Japanese varieties, distinct, in vases, also for one vase of five blooms of a white variety, with William Turner; one of the blooms in this vase was adjudged the best Japanese Chrysanthemum in the show. The same exhibitor showed the best vase of five blooms of any coloured Japanese variety with F. S. Vallis.

The vegetables classes were keenly contested. Mr. Hartless excelled in both Messrs. Carter's and Sutton's classes for collections. Mr. E. Kinns was placed 2nd in both classes.

Fruit.—The best of seven exhibits in the class for two bunches of white Grapes was shown by Mr. Jefferies. There were nine entries in the class for two bunches of black Grapes, and Mr. Croxford was placed 1st with large, handsome bunches of Muscat Hamburgh. Mr. T. Pateman showed best in the class for Apples and Pears. This exhibitor won the 1st prize for a collection of fruit with choice Grapes, Apples, and Pears. Lord Hampden (gr. Mr. C. E. Martin) was placed 2nd.

BRADFORD CHRYSANTHEMUM.

November 15, 16.—The twenty-sixth annual exhibition of this society was held on these dates. The entries, although scarcely so numerous as last year, compared favourably with previous exhibitions.

Cut Blooms.—In the open class for 24 Japanese blooms in not fewer than 18 varieties, Sir Wm. Bass, Burton-on-Trent (gr. Mr. R. Nisbet), was awarded the 1st prize. His best blooms were Frances Jolliffe, Mrs. David Syme (the premier flower in the show), Wm. Gee, Mrs. Mersham, Wm. Biddle, F. S. Vallis, Wm. Turner, Mrs. K. Luxford, and White Queen. 2nd, Arthur James, Esq., Coton House, Rugby (gr. Mr. A. Chandler), with fresh, bright, but smaller blooms.

Local Classes.—For 24 blooms, Incurved, the 1st prize was won by Mr. H. B. Farmer. 2nd, Mr. A. Chandler. Mr. Chandler was also awarded the 1st prize for six vases of Japanese blooms. For 18 Japanese blooms in not fewer than 12 varieties, Mr. John Thornton, Drighlington, was placed 1st. 2nd, Mrs. Constable, Otley (gr. Mr. W. H. Aldridge). Mr. H. Clark was successful in the class for 12 Incurved blooms, and the 1st prize for six dissimilar Japanese varieties was won by Mr. J. Thornton. 2nd, Mr. W. H. Aldridge.

Messrs. Wells & Co., Ltd., Merstham, exhibited Chrysanthemums, including the new variety Queen Mary.

ROYAL METEOROLOGICAL.

November 20.—The opening meeting of this Society for the session was held at the Surveyors' Institution, Dr. H. H. Dickson, President, in the Chair.

Dr. H. R. Mill, Director of the British Rainfall Organization, read a paper on the unprecedented rainfall in East Anglia on August 26 last. He based his discussion on the records of 265 rainfall observers in the eastern counties, from which he constructed a series of maps, showing the hour of commencement and of cessation of rain and the total rainfall of the 24 hours in question. The rain commenced in London between 1 and 2 a.m. on August 26, but the hour of commencement grew later towards the northward, rain not beginning to fall in Lincolnshire until after 7 a.m. The intensity of the fall increased rapidly over the whole area, the maximum being reached in a fall of 4 inches in 4 hours from 11 a.m. in the neighbourhood of Norwich. The rain afterwards diminished in intensity and gradually ceased, the hour of cessation being 6 p.m. round the outside of the area affected from Orford Ness to Grantham, but later towards the centre, where, over nearly the whole of Norfolk and a large wedge of Suffolk, it did not cease until after midnight on the 26th, and at some places not until 4 or 5 a.m. on the 27th. In this central area the rain fell without intermission for more than 20 hours, and at some points probably for 24. The distribution of the rain was somewhat remarkable. There were two foci of maximum fall, both in Norfolk, the northern central south of Cromer with more than 7.50 inches, the larger central east of Norfolk culminating in about 20 square miles, with more than 8 inches of rain in the 24 hours. About 1940 square miles in Norfolk and Suffolk had more than 4 inches of rain, the most curious feature being a triangle of much lower rainfall running through the west of Norfolk south-eastward from the Wash. The area with more than 2 inches of rain was at least 5,800 square miles. The general rainfall of each of the counties was calculated for this day and also for the various river basins; and, speaking generally, it was said that during the 24 hours as much water was deposited on the land as would fall in normal circumstances in two or three months. Several very heavy falls of rain in one or two days which had been recorded in different parts of the country were considered, and it was shown that, although more than 8 inches had fallen at Seathwaite, in the Lake District, on more than one occasion, as the result of one or two days rain, there was no instance of so large an area having more than 6 inches of rain in two days as occurred in East Anglia on August 26. Former flood-rains in the same area were considered, and shown to have been quite insignificant in comparison; and only two instances could be found—July, 1875, and November, 1878—when the rainfall of a whole month surpassed that of of these 24 hours. The cause of the prolonged torrential downpour was not to be found in the physical geography of the district affected, but in the meteorological conditions for the full elucidation of which the data were insufficient. The fact that a small secondary depression had passed northward from the English Channel to the coast of Norfolk and then turned eastward across the North Sea suggested a relationship with a similar though less intense rainstorm which affected the east of Ireland on August 25, 1905, when a similar depression passed northward from St. George's Channel to the coast of Wicklow and turned off abruptly across the Irish Sea. Considering the unprecedented magnitude of the volume of rain precipitated the floods, of which a series of photographs was shown, were remarkable rather for their moderation than for the destruction wrought.

Mr. A. P. Jenkin also read a paper on a three-year period in rainfall.

NORWICH CHRYSANTHEMUM.

NOVEMBER 21, 22, 23.—This annual show was held in St. Andrew's and Blackfriars Halls on these dates, and proved a great success.

A Challenge Cup was offered for a circular group of Chrysanthemums and foliage plants 8 feet in diameter. E. G. BUXTON, Esq., Catton Park, Norwich (gr. Mr. F. Notley), won the cup with fairly good blooms of Japanese varieties, freely-flowered singles, and good foliage plants, but the exhibit was not well arranged. 2nd, G. E. WHITE, Esq., Eaton House, Norwich (gr. Mr. D. Cockeril).

The most important class for cut blooms was for 48 specimens of Japanese Chrysanthemums, not fewer than 36 varieties. Sir CARL MEYER. Shortgrove, Newport (gr. Mr. E. Guile), won the 1st prize easily with fine, fresh blooms of Mrs. G. Drabble, J. C. Neill, Mary Farnworth, Leviathan, Fred Green, F. S. Vallis, E. M. Quickendon, Acquisition, Mrs. W. Iggulden, W. Turner, and others. Sir S. NEWMAN, Rainham Hall, Norfolk (gr. Mr. H. E. Stredwick), was placed 2nd; 3rd, W. H. PALMER, Esq., Ormesby (gr. Mr. E. G. Leach).

In the class for 36 Japanese blooms, open to growers in the county of Norfolk, five competed. The best blooms were shown by T. O. RISBY, Esq., Ormsby (gr. Mr. C. Nichols), whose best varieties were W. Rawlings, J. H. Silsbury, Frances Jolliffe, W. Mease, and Mrs. F. Vallis. W. T. F. JARROLD, Esq., Roxley Thorpe (gr. Mr. W. Marjoram), was awarded the 2nd prize.

The best 12 Japanese blooms, distinct, were shown by Sir G. BARON, Ormsley Hall (gr. Mr. H. Spiri). Especially fine were the six Japanese blooms exhibited by Mr. J. E. PRENTICE, London Road, Harleston; his flowers of Glaucous, Lady Crisp, and Bessie Godfrey were equal to any in the show. Mr. J. F. GAYMER, Millfield Cottage, North Walsham, was a good 2nd. In the class for six blooms of a white Japanese variety, Sir J. NEWMAN staged exceedingly fine specimens of the pure white W. Turner, and secured the leading award. This exhibitor also excelled in the class for six blooms other than a white variety with F. S. Vallis.

Prizes were offered for a group of cut blooms arranged on a table with any foliage. Sir G. BACON was placed 1st in this class.

Incurved blooms were few in number but fairly good in quality. Sir C. MEYER had the best exhibit of 12 varieties. Doris Rayner, Clara Wells, Duchess of Fife, Mrs. G. Denyer, Fred Palmer, Triomphe de Montbrun, and Mrs. Hygate were the best varieties.

There were six classes for naturally-grown Chrysanthemums—terminal sprays. For 12 varieties, arranged in vases, six sprays in each, C. E. WHITE, Esq., excelled with an attractive exhibit of such useful decorative varieties as Lizzie Adcock, M. Julien Valet, Champion Exe, Dr. Englehard, and Source d'Or. 2nd, Mr. E. F. GREEN.

There were excellent exhibits of Carnations, Violets, and Begonias. In the fruit classes Apples and Pears were especially good. For three bunches of black Grapes, distinct, Col. HARBORD won the 1st prize with Black Alicante, Gros Maroc, and Gros Colman. The best three bunches of Black Alicante were shown by E. REEVE, Esq. (gr. Mr. E. Florence). The finest Muscat of Alexandria Grapes were exhibited by F. A. RISING, Esq., Ormesby (gr. Mr. C. Nicholls). There were numerous exhibits in the class for 10 varieties of dessert Apples. Lord STRADBROOK, Henham Hall (gr. Mr. F. Simpson), won the 1st prize with splendid fruits. Lord STRADBROOK also excelled in the class for nine varieties of culinary Apples. Col. PETRIE, Westwick, won quite easily the premier prize for six varieties of dessert Pears with grand fruits.

NON-COMPETITIVE EXHIBITS.—Messrs. DANIEL BROS., Norwich, furnished one end of St. Andrew's Hall with a fine display of Chrysanthemums and other flowers. (Gold Medal.)

Messrs. SUTTON & SONS, Reading, staged a large collection of vegetables. (Gold Medal.)

Messrs. W. WELLS & Co., LTD., Merstham, showed Chrysanthemums. (Gold Medal.)

Messrs. HOBBIES LTD., Wisbech, showed Liliums, Roses, Dahlias, Begonias, and Chrysanthemums. (Gold Medal.)

Mr. G. W. MILLER, Clarkson Nurseries, Wisbech, arranged, in front of the orchestra, an attractive group of Orchids. (Gold Medal.)

Mr. W. SEABROOK, Chelmsford, and Mr. R. C. NOTCUTT, Ipswich, showed collections of Apples.

ABERDEEN CHRYSANTHEMUM.

NOVEMBER 22, 23.—This show was held in the hall of the Young Men's Christian Association, Aberdeen, on the above dates. The exhibits were well up to the standard of previous years, and the entries were numerous.

POT PLANTS.—For a group of Chrysanthemums and other plants arranged in semi-circular form on a space 8 feet by 4 feet, the 1st prize, a piece of silver plate, was won by A. R. GRAY, Esq., of Garthdee, Aberdeen (gr. Mr. Robert Begg). It was a capital group. A Kentia Palm formed the crown, while Cocus Weddelliana added to the effect. The Chrysanthemum blooms included finely-grown specimens of Mrs. Lopes, Mrs. A. T. Miller, the new white Master James, J. H. Silsbury, and several beautiful singles. Colonel STUART RICHARDSON, of Ballathie, Perthshire (gr. Mr. John E. Davies), was placed 2nd. Mr. A. R. GRAY also won the 1st and 2nd prizes for specimen Chrysanthemums in pots, his entries including a magnificent pot of the Nellie Pockett variety. For single and decorative Chrysanthemums Mr. GRAY also took leading honours.

CUT BLOOMS.—Colonel STUART RICHARDSON, Ballathie (gr. Mr. John E. Davies), won the 1st prize easily in the class for 18 blooms of Japanese Chrysanthemums, six varieties. His blooms included choice specimens of Mrs. F. W. Vallis, Mme. P. Radaelli, Master David, Mrs. Eric Crossley, Wm. Turner, and Mrs. F. S. Vallis. Sir CHARLES FORBES, Bart., of Newe, Strathdon, Aberdeenshire (gr. Mr. John McRobbie), was a good second. In the class for six blooms of yellow and white Japanese Chrysanthemums, Mrs. THORNTON, Thornton Castle, Kincardineshire (gr. Mr. Duncan McLean), was placed 1st. Mrs. DUNBAR-DUNBAR, Seapark, Forres (gr. Mr. J. A. Grigor), closely followed. The last-named exhibitor won the premier award in the class for 12 blooms. The best three blooms of one variety were shown by Mrs. THORNTON, and the best 18 vases of decorative Chrysanthemums by Mrs. DUNBAR-DUNBAR.

The best collection of kitchen Apples was shown by A. B. INNES, Esq. (gr. Mr. C. Stuart). He also showed the best dessert Apples. Mrs. DUNBAR-DUNBAR, Seapark, Forres, carried off the chief honours for dessert Pears. Grapes were not much in evidence, but the bunches of Black Alicante shown by Mr. COUPER, of Craigiebuckler, were well worthy of the 1st place.

LINNEAN.

NOVEMBER 21.—A general meeting of the Society was held on this date, Prof. E. B. Poulton, F.R.S., President, in the Chair.

The Rev. George Henslow, M.A., gave the substance of his paper, "On Vegetable Mechanics," as follows:—

The object of this paper is to show that plants respond to gravity, strains and stresses, in order to resist them and so secure stability. Kerner thought that the stems of herbs and trunks of trees were constructed on a combined system of girders; but if a tree has a heavy mass of foliage borne at the summit of a tall cylindrical stem (as of mahogany), or even a short one (Fagus Rumphii) buttresses are often formed by the roots, which enable the tree to keep the centre of gravity over an extended base.

If the stem be hollow, diaphragms are introduced to render it secure. These are in some cases cup-shaped as in East Indian Bamboos, thereby securing a greater "pull" against lateral injury.

In tropical lianes, various mechanical contrivances secure strength with elasticity. In Bauhinia there are cup-shaped bulgings on either side of a flattened stem. In the Monkey-ladder (Caulotretus), besides the bulgings, flanges are added on the edges, making a complete girder.

In Cucurbitaceæ and Passiflora the tendril coils, after securing a hold by its curled tip, the coils being in opposite directions. This is secured by a "crank" being first formed which rotates.

In leaves, the distribution of the mid-rib and veins secures the blade from transverse bending and tearing. In Bananas, the leaves, being degenerate in character, are invariably torn to shreds by the wind.

In flowers adapted to insects various mechanical contrivances enable the calyx and corolla, or the stamens, to support the insect; while others enable it to carry the pollen away. The calyx multiplies its ribs and the corolla expands anteriorly, while the stamens become levers, &c.

Fruits are often subject to strains as in bursting, but if a Pear hangs vertically from an oblique stalk, there is a tendency to tear it away. Nature then develops a hump at the base which counteracts the resultant of the two other forces.

The whole of the purposeful structures to secure strength to resist injurious strains, is the issue of the directivity of life.

NATIONAL CHRYSANTHEMUM.

ANNUAL DINNER.

NOVEMBER 27.—Members and friends of the National Chrysanthemum Society met at dinner on this date in the Royal Venetian Chamber of the Holborn Restaurant. The room was lavishly decorated with Chrysanthemums; a bank of large exhibition blooms, relieved with Palms and other greenery, was arranged along one side of the Hall, whilst the tables were gay with epergnes of smaller decorative varieties. The company, which numbered 105, included many ladies. Amongst those present we noticed Messrs. Thomas Bevan, E. F. Hawes, J. Witty, D. B. Crane, C. Harman Payne, R. J. Frogbrook, J. W. Moorman, W. Wells, Norman Davis, T. Stevenson, R. B. Leech, G. Hunt, and R. A. Witty (secretary). The Secretary read a letter from the president, Sir Albert Rollit, LL.D., regretting his inability to be present owing to indisposition. In the president's absence, and at his express wish, Mr. Thomas Bevan, chairman of the committee, occupied the chair.

After the usual loyal toasts had been honoured, the chairman gave the toast of "The National Chrysanthemum Society." Mr. Bevan referred with regret to the absence of the president. He gave a brief history of the Society from the time when it was formed from the old Stoke Newington Chrysanthemum Society, and referred to the wonderful progress seen in all sections of the flower since that time. There was, he said, a possibility of some of the older sorts appearing again under new names, for in some of the varieties on the tables he fancied he saw familiar faces, and this must be taken into consideration in awarding certificates to novelties. The toast was received with enthusiasm. The chairman then proceeded to distribute the medals, cups, and other trophies won at the Society's exhibitions

The next toast was "The Donors of Special Prizes," proposed by Mr. E. F. Hawes. Mr. Hawes said the Society was greatly indebted to those who had offered these special prizes, which, as those present could see, were numerous and valuable. They were indebted to their president for one of the handsome cups, and he, Mr. Hawes, proposed that a telegram should be sent to Sir Albert Rollit regretting his absence, and wishing him a speedy recovery. The proposal was received with acclamation. Mr. R. J. Frogbrook, in responding to the toast, expressed the satisfaction of those who had contributed special prizes, for the competitions were excellent, and the quality of the exhibits everything that could be desired.

Mr. C. B. Crane proposed "The Exhibitors and Affiliated Societies." The trade exhibits, said Mr. Crane, were the finest ever seen at the N.C.S. exhibitions, and he especially mentioned those of Messrs. Norman Davis, W. Wells & Co., H. J. Jones, John Peed & Son, and Craig, Harrison and Craig. He also referred to the great success of Mr. Thomas Stevenson, who won the 1st prizes in all the important classes at the principal show.

Mr. Wells, in responding, expressed the indebtedness of the traders to Mr. Caselton, the superintendent of the Crystal Palace, for his courtesy and help. He considered that there should be a rigorous selection of novelties submitted for awards.

The toast of "The Chairman" was proposed by Mr. C. Harman Payne in a humorous speech. He said that Mr. Bevan was a man of resource, perseverance, courtesy, and kindliness, and a keen supporter of the National Chrysanthemum Society. The toast was received with musical honours.

Other toasts were "The Press," proposed by Mr. J. W. Morman, and responded to by Mr. J. Harrison Dick, and "The Ladies and Visitors," proposed by Mr. J. McKerchar.

PERPETUAL-FLOWERING CARNATION.

December 3, 4.—The 13th exhibition of the Perpetual-flowering Carnation Society, held at the R.H.S. Hall on these dates, will rank as the best in the history of the Society. The entries were above the average, the exhibits were of high quality, and there was a large attendance of visitors.

Open Classes.

The three groups of cut Carnations, arranged on tabling 10 feet by 3 feet, with decorative plants or cut foliage, presented a very attractive appearance. A large number of excellent blooms of the best varieties were used by the several competitors. The 1st prize was won by Mr. C. Engelmann, Honeybrook Nursery, Saffron Walden, with a tastefully-arranged collection. The outstanding varieties were Sunstar, Rose Doré, Lady Northcliffe, Carola, and Pink Delight. The 2nd prize was awarded to Messrs. Wells & Co., The Nurseries, Merstham, Redhill, for a very bright exhibit. The varieties Scarlet Glow (which has such an appropriate name), Dorothy Gordon, and Northport were especially noteworthy. 3rd, Col. Rideout, Langley, Bucks, who showed a smaller collection of very fresh blooms.

The only exhibit of three vases containing 12 blooms of British novelties distributed since January 1, 1910, was that of the varieties Sunstar, Lady Northcliffe, and Carola, for which the Brunton Challenge Cup was worthily awarded to Mr. Engelmann.

The Challenge Cup presented by the American Carnation Society for a similar collection of American novelties was awarded to Mr. H. F. Mason, Church Farm Nursery, Hampton Hill, Middlesex, for three vases of exceedingly fine blooms of Dorothy Gordon, Gloriosa, and White Wonder; 2nd, Mr. W. E. Wallace, The Nurseries, Eaton Bray, Dunstable; 3rd, Mr. C. Engelmann.

The class for "25 blooms, any one variety, Enchantress, Mrs. Chas. Knopf, and similar colours," was responsible for eight vases of charming flowers. The 1st prize was awarded to Mr. E. Guile, The Gardens, Shortport, Newport, for a splendid vase of his variety Lady Meyer; 2nd, Mr. W. E. Wallace; 3rd, Col. Rideout.

Messrs. Stuart Low & Co., Bush Hill Park, Enfield, won the 1st prize in the class for a vase of Carnations of medium shades of pink with the variety Baroness de Brienen; 2nd, Mr. W. E. Wallace; 3rd, Mr. C. Engelmann.

The best vase of rose-pink Carnations was that of Gloriosa shown by Mr. W. E. Wallace; 2nd, Col. Rideout.

The premier vase of any deep pink variety was "Una Wallace," shown by Mr. W. E. Wallace; 2nd, Mr. C. Engelmann.

The white varieties shown were mostly White Perfection, and the 1st prize was won by Mr. H. F. Mason, Church Farm Nursery, Hampton Hill, Middlesex, with beautiful blooms; 2nd, Mrs. Collins, Heathfield Nursery, Swanley; 3rd, Col. Rideout.

Scarlet Glow, as shown by Mr. W. E. Wallace, was decidedly the best of the scarlet varieties; 2nd, Mr. H. F. Mason, who showed Beacon; 3rd, Mr. H. J. Dudney, The Nursery, South Road, Erith, Kent.

There were only two vases in the class for crimson or clove-coloured blooms. The 1st prize was won by Mr. W. E. Wallace for a splendid vase of Carola; 2nd, Mr. C. Engelmann.

Mr. Wallace also won the 1st prize for a vase of Fancy Carnations; he showed Benora in very good form; 2nd, Messrs. Stuart Low & Co; 3rd, Mr. C. Engelmann.

Mr. A. F. Dutton, The Nurseries, Iver, Bucks., won the 1st prize for the best vase of any other self Carnation with the variety Mikado. 2nd, Col. Rideout.

Mrs. Bide was the only exhibitor of a basket of Carnations, and was awarded the 1st prize for a tasteful arrangement.

The six dinner tables were all decorated with pink-coloured Carnations. The arrangement which won the 1st prize for Mrs. Bide, Highfield, Guildford Road, Farnham, was very dainty and charming; 2nd, Sir Randolf Baker, Bart., Ranston, Blandford (gr. Mr. A. E. Usher); 2nd, Mr. H. E. Guile.

The best three ladies' sprays were shown by Mr. S. F. Jackson, Danehurst, Epsom; 2nd, Miss E. Guile; 3rd, Mr. R. B. Leach, Dulwich.

The best six gentlemen's coat flowers were shown by Capt. Weiner; 2nd, Mr. Wm. Heath, The Hylands, Chelmsford; 3rd, Mrs. E. Guile.

Mr. W. Heath was awarded the 1st prize for a bright hand-basket of Carnations; 2nd, Mr. W. Holder; 3rd, Mrs. A. Bide.

Amateurs' Classes.

Lord Howard de Walden's challenge cup for the best semi-circular group of Carnation plants was awarded to Cecil F. Raphael, Esq., Porter's Park, Shenley, Herts. (gr. Mr. A. Grubb), who showed a highly meritorious collection. The blooms were very large and fresh and of excellent colour. 2nd, Mrs. Bischoffsheim, Warren House, Stanmore. 3rd, Mrs. Adair, Adair Place, Englefield Green (gr. Mr. W. Holder).

The two circular tables of cut Carnations were an agreeable change. The 1st-prize table, arranged by Sir Randolf Baker, Bart. (gr. Mr. A. E. Usher), evoked the admiration of many visitors; 2nd, Mr. H. Smith, Epping House, Little Berkhamsted, Herts., whose style of arrangement was in several respects the better, but the blooms lacked the high quality of the 1st-prize exhibit.

Three of the four dinner tables were decorated with pink Carnations. The 1st-prize table (Sir Randolf Baker) was run very closely by that arranged by Mr. W. Holder, of Adair Place Gardens.

Sir Randolf Baker also won the 1st prize for six Carnation plants (2nd, Mrs. Adair, who showed smaller but well-grown plants) and the Stuart Low prize offered for the best plant of the variety Baroness de Brienen, as well as for the best vase of that firm's novelties.

In the class for 12 blooms of Burnett's novelties, Sir Randolf Baker, Bart., was equally successful, whilst the best six blooms were shown by Capt. Weiner, Ewell Castle, Surrey.

The gold medal offered by Messrs. Wells & Co. for six blooms of four specified varieties was won by Sir Randolf Baker; 2nd, Lord Burnham, Hall Barn, Beaconsfield (gr. Mr. J. Johnson).

The class for one vase containing 25 blooms of Carnations was strongly contested. The 1st prize was won by Sir Randolf Baker; 2nd, S. F. Jackson, Esq.

In the colour classes, Sir Randolf Baker was generally successful. He won the 1st prizes in the classes for varieties of the Enchantress shade of colour, the Mrs. Burnett type, the rose-pink, and for the deep pink. Second prizes were awarded to Mr. J. West, Old Windsor; Mr. H. S. Culwick, The Gardens, Westlake, Yeovil.

The 1st and 2nd prizes for white varieties were awarded to Mr. S. F. Jackson and Sir Randolf Baker in the order named; whilst in the class for scarlet varieties Sir Randolf Baker was again leading, with Capt. Weiner 2nd.

The best clove-coloured blooms were shown by Mr. S. F. Jackson and Capt. Weiner.

The 1st prize for any other Self was won by F. Ricardo, Esq., The Friars, Old Windsor (gr. Mr. G. West); 2nd, Sir Randolf Baker, who gained the 1st prize for Fancy Carnations.

The "Dutton" prizes for 12 blooms of specified varieties were won by Sir Randolf Baker and F. Ricardo, Esq., in the order named.

Sir R. Baker also won the special prize offered by Mr. C. Engelmann, for six plants in bloom; 2nd, Mrs. Adair.

In the sections restricted to amateur members, who employ a part-time gardener, or who cultivate their Carnations unaided, Mr. C. Loosemore, Rodwell Station, Weymouth, was the most successful exhibitor. Mr. T. H. Plowright, Windsor, won the 1st prize for self-Carnations.

Non-Competitive Exhibits.

Mr. C. Engelmann, Saffron Walden, Essex, filled a large part of the end of the hall with an enormous collection of splendid cut Carnation blooms. The tall stands contained such varieties as Lady Northcliffe, Enchantress, and White Perfection. The clove-coloured Carola was exceptionally fine, as also were the blooms of Dorothy Gordon, Princess Charming, Sunstar, Red Jessica and Beacon. Several seedlings of different colours promise to develop into useful varieties. (Gold Medal.)

Messrs. Stuart, Low & Co., Bush Hill Park, Enfield, had an imposing show of cut Carnations, arranged in an effective manner. Besides several interesting seedlings the novelties Rosette (deep pink), Cinnabar (dull rose), British Triumph (clove-coloured) and St. Nicholas (scarlet) were worthy of admiration. (Gold Medal.)

Mr. W. Lawrenson, Yarm-on-Tees, showed many well-known varieties and Snowstorm (white), and Mrs. Charles Page (very large shaded pink of the Remontant type). (Silver-gilt Medal.)

Messrs. Young & Co., Hatherley, Cheltenham, exhibited in the Hon. John Boscawen (soft pink) and Mrs. Brodie-Henderson (faded rose), two new varieties. (Silver-gilt Medal.)

Mr. G. Lange, Hampton, showed Scarlet Glow, Alma Ward, Mrs. W. C. Ward, &c., in typical form. (Silver Medal.)

Messrs. Allwood Bros., Wivelsfield Nurseries, Haywards Heath, arranged many choice varieties in an exceedingly attractive manner. The novelties included the richly-coloured Mary Allwood, which has such a delightful fragrance, Geisha, Salmon Enchantress and Empire Day, especially desirable varieties. (Silver-gilt Medal.)

Mr. H. Burnett, Guernsey, showed splendid examples of Marmion, Mandarin, Beacon, Benora, R. F. Felton and Sunstar. (Large Silver-gilt Medal.)

Messrs. Wm. Cutbush & Son, Highgate, London, included in their attractive group a large stand of the glowing scarlet variety Mrs. L. Mackinnon, and smaller collections of such valuable sorts as Viscountess Goschen, Lady Coventry, Lady Meyer and Mrs. Waldorf Astor. (Silver Medal.)

Mr. A. F. Dutton, Iver, Bucks., displayed a large number of blooms of the variety Mrs. A. F. Dutton, which received an Award of Merit. (See R.H.S. awards.)

Messrs. Felton & Sons, Hanover Square, London, exhibited a very interesting collection of the best British-raised novelties. (Silver-gilt Medal.)

AWARDS OF MERIT.

Mary Allwood (see p. 394).—Shown by Messrs. ALLWOOD BROS.

Baroness de Brienen.—This salmon-pink variety received an R.H.S. Award of Merit, November 7, 1911. Shown by Messrs. STUART LOW & CO.

Snowstorm (see p. 394).—Shown by Messrs. W. LAWRENSON & SON.

Mrs. A. F. Dutton (see R.H.S. Awards, fig. 187).—Shown by Mr. A. F. DUTTON.

SANQUHAR HORTICULTURAL.

THIS society held its annual meeting in the Town Hall, Sanquhar, recently. Mr. J. Thomson occupied the chair, and a highly satisfactory report was submitted by Mr. John Milligan, secretary and treasurer. The debt has been cleared off through the results of a successful year's operations, and there is a small credit balance. Mr. Jas. Moffat was elected president, Mr. John Milligan secretary and treasurer, and Mr. R. M'Kendrick, Junr., assistant secretary.

DEBATING SOCIETIES.

STIRLING & DISTRICT HORTICULTURAL.—At the meeting of this association held on the 5th ult., in the Y.M.C.A. Hall, Stirling, a lecture on "Cork, Cork Trees, and Cork Growing" was delivered by Major Yates. The lecture was illustrated by limelight views. Mr. M. Chapman gave a résumé of the outstanding features of the gardens visited by the society during the season.

KILMARNOCK AND DISTRICT GARDENERS'.—The second lecture of the present session was given on the 13th ult. by Mr. A. Hosking, instructor in horticulture to the West of Scotland Agricultural College, the subject being "Plant Hybridisation," with a reference to "Plant Breeding." Mr. Hosking pointed out the necessity of a knowledge of the structure of flowers, the different methods of pollination, and the various precautions to be taken in order to effect successful crossing by artificial means, illustrating his lecture with specimens. After a reference to the historical aspect of the subject, Mendelism and graft hybrids, plant-breeding by selection was dealt with.

BRISTOL AND DISTRICT GARDENERS'.—A meeting of this association was held in St. John's Parish Rooms, Clifton, on November 14. Mr. Thoday presided over a large attendance. Mr. C. H. Cave, vice-president, gave a lecture on "Hybridising of Daffodils."

——— A meeting of the above association was held on the 28th ult. A lecture was delivered by Mr. Lovelock, of the King's Dene Nurseries, on "Pot Fruit Culture." The prizes offered by Messrs. James Carter & Co. for a selection of vegetables were won by Messrs. Benfield, Miles and Young in this order.

CARDIFF GARDENERS'.—The usual fortnightly meeting of this association was held at the Queen's Hotel, Cardiff, on the 12th ult.: Mr. A. H. Cossom presided. Mr. Garnish, a member of the Bristol association, read a paper on "Bulbs in Pots and Boxes for Cutting."

——— At the meeting held on the 23th ult. Mr. A. H. Cossom presided over a moderate attendance of the members. Mr. Fry, gardener at The Court, Llandaff, delivered a paper on "The Perpetual-flowering Carnation." Mr. Fry stated that propagation should be commenced in November. He recommended layering from old plants in July, as plants thus obtained were stronger than those raised from cuttings. Mr. Fry dealt with the various insects and other pests of the Carnation. He stated that if the plants were kept growing in a healthy condition very little trouble would be experienced with rust disease.

BATH GARDENERS'.—A meeting of this society was held at the Foresters' Hall, Bath, on the 12th ult. Mr. Parrott, the chairman, presided. Mr. J. Merchant gave a paper on "The Fragrance of Roses." The lecturer referred to the fine perfume of the old Damask and Provence Roses, and among the newer Roses singled out for special mention on account of their perfume Hugh Dickson, Commandant Félix Faure, Conrad F. Meyer, Rose a Parfum de L'Hay, La France, Maréchal Niel, Madame Alfred Carriére and Cherry Ripe.

CHELMSFORD AND DISTRICT GARDENERS'.—The fourth meeting of the winter session was held in the Institute of Agriculture on the 15th ult. Mr. Malins Smith presided, and about 60 members attended. Previous to the lecture a competitive exhibition of Chrysanthemums was held; the first prize was won by Mr. Hunt, second Mr. Killingby. A non-competitive exhibit of these flowers was shown by Mr. White. Mr. C. E. Searls gave a lecture on "Lawns, Bowling Greens and Tennis Courts."

——— A meeting of this association was held in the Institute of Agriculture on the 29th ult. Mr. C. J. Simpson occupied the chair, and about 40 members were present. Mr. C. Wakely gave a lecture on "Pot Plants and Potting." In order to make the lecture of practical value Mr. Wakely brought specimens of pot plants and potting materials.

RUDDINGTON & DISTRICT GARDENERS'.—At the meeting held on the 12th ult., Mr. R. Sutton gave a lecture on "Gardening" in the absence, through illness, of the appointed lecturer, Mr. Horace J. Wright. Mr. Baynes Smith presided. Mr. R. Sutton said the title of his lecture should be "Gardening, Limited," for he only intended to speak of the first and most important part of a gardener's work. This was double-digging, and though the work was hard, a gardener was well repaid by the better crops which were the result, especially if special manures or soils were incorporated. The Chairman spoke of the fruit grown so successfully in the dry belt in Canada as the result of deep cultivation. Mrs. Wray Hunt, in proposing a vote of thanks to the lecturer, said that the vivid pictures of a garden reminded her of the words of a great man: "If you have beautiful thoughts in your mind, you have always a garden in flower."

WARGRAVE AND DISTRICT GARDENERS'.—A meeting of the association was held on Wednesday, November 13, and there was a good attendance of members to hear a paper on "Seed Sowing" delivered by Mr. J. A. Hall, Gardener at Shiplake Court. He said he would take the question "When shall I sow my seeds?" and endeavour to answer it from his own experiences at Shiplake Court. He first explained that water, heat and air were necessary for germination, but sometimes germination was irregular. There were several causes for this. It was generally found that if seeds were sown soon after they were gathered, germination was speedy. Healthy seeds often rotted owing to excess of moisture. Attention was then drawn to the number of seeds produced by some plants. Thick sowing and overcrowding were greatly deprecated. The various depths for sowing were mentioned, and the different methods of covering till germination occurred were described. Mr. Hall gave a general list which could be used month by month, commencing with January.

——— At the meeting held on the 27th ult. competitions in vase decorations were arranged, and there were 13 entries. The prize-winners in the head gardeners' and foremen's class were:—1st, Mr. A. Histead, Old Vicarage Gardens, Shiplake; 2nd, Mr. W. H. Scott, Hermitage Gardens, Twyford; 3rd, Mr. H. Attlesey, Wargrave House Gardens; and in the class for journeymen: 1st, Mr. Bristow, Scarlet's Gardens, Hare Hatch; 2nd, Mr. R. Baker, Park Place Gardens; and 3rd, Mr. Dancer, Scarlet's Gardens, Hare Hatch. The flowers used in the competitions were sent to the Royal Berkshire Hospital the following morning.

READING GARDENERS'.—A large attendance of members gathered on Monday evening, the 18th ult., at the Abbey Hall, when Mr. E. F. Hazelton, of The Gardens, North Mymms, Hertford, gave a paper on "The Treatment of Pears." The lecturer stated that his experience with different varieties of Pears, and more particularly as to flavour, on various types of soil in widely-separated districts, had been so contradictory that he hardly cared to dogmatise as to which were the best varieties when considered from the point of view of quality. Local experience must be the chief guide in the matter. In the discussion which followed the reading of the paper, points were raised on the respective merits of the Pear and Quince stocks; whether to prune Pear trees the first season after planting or not; the character of good Pear soils, the general deficiency of flavour in Pears in 1912, together with the unusual early maturity of late varieties.

NORTH OF SCOTLAND HORTICULTURAL AND ARBORICULTURAL.—A meeting of this association was held in the Aberdeen University Buildings on Wednesday, 20th ult. A paper entitled "A Trip to Holland and the Bulb Fields," was read by Mr. A. Brown, of Messrs. Alexander & Brown, Nurserymen, Perth. With the aid of beautiful lantern slides, Mr. Brown gave a capital account of a visit he paid to Holland in the spring two years ago. He described in a delightful manner the many varieties of Daffodils, Tulips, Hyacinths, &c., grown in Holland, showed on the screen many photographs of beautiful specimens, and concluded with some valuable and practical hints as to cultivation, drainage, soil, &c. Mr. Douglas, gardener to Alex. Ogilvie, Esq., of Kepplestone, Aberdeen, dealt with flowers. Referring to Sweet Peas, he stated that those which had done best with him during the past unfavourable season had been Lady Evelyn Eyre, Hercules, Dobbie's Cream, and Juliet. Dealing with Primulas, Mr. Douglas said that since the introduction of Primula obconica several fine varieties had been sent out with flowers of varying shades of rose and rosy red, but the aim of many lovers of that plant had been to obtain a really bright red variety. That had now been secured in Primula obconica Kemmercinæ. Mr. Douglas also referred to several new herbaceous plants, specially commending a lovely salmon pink Astilbe.

DEVON AND EXETER GARDENERS'.—At the meeting held on the 27th ult. Mr. Charles Thomas, Poltimore Gardens, gave a lecture on "The Carnation and its Cultivation." Mr. A. Hope presided. Mr. Thomas said that in 1629 Carnations were the greatest of garden favourites. The application of manure at the time of planting was not to be recommended, but if the soil was poor a dressing of manure, wood ashes, or soot would be beneficial. It was necessary to get the young plants well established before the winter months, as a safeguard from frosts and trying winds. The middle of July was not too early to commence layering, and the work should be completed by the middle of August. The lecturer enumerated Duchess of Fife, Mrs. Nicholson (pink), Trojan (white), Midas (buff), Omar (crimson), G. E. Draper, Leander, Uriah Pike, Goldilocks, Aurelian (yellow ground), and Fancy as desirable varieties.

Obituary.

CAPTAIN HENRY ROGERS.—We regret to record the death, at Plymouth, on the 26th ult., of Captain Henry Rogers, R.N., in his 88th year. Capt. Rogers contributed notes on forestry to these pages from time to time, giving his experiments on the commercial value of thinning plantations. The last article appeared in the issue for December 30, 1911. He commenced planting trees as far back as 1857, and kept careful records in a "log" of the growth of the various trees.

ENQUIRY.

CATS AND BULBS.—Can any reader inform me how to prevent cats from scratching up bulbs planted in flower-beds? I have tried pepper, but this is rendered useless by the first rain. *W. A. H.*

MARKETS.

COVENT GARDEN, *December 4.*

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

Remarks—English dessert and culinary Apples continue a very heavy supply, and many growers still have large stocks to dispose of. Importations of Apples in boxes and

varieties of English and imported Pears are available:—Doyenné du Comice, Winter Nelis, Easter Beurré, Passe Crassane and Kieffers. The Kieffer Pears are packed largely in barrels. There are large supplies of English hothouse Grapes with the exception of Muscat varieties. English Tomatos are finished, but Teneriffe Tomatos are arriving in an excellent condition. Mushrooms have not been so plentiful this week. Dwarf Beans from Madeira are an increasing supply, and the Channel Islands Seakale is now more abundant. Forced Peas (Guernsey) are obtainable in larger quantities than hitherto. Walnuts are nearly over, but there is a greater demand for Cobnuts. Other nuts, such as Chestnuts, Brazils, Almonds, &c., are plentiful. Very heavy consignments of fruit are now arriving in readiness for the Christmas trade. Ordinary vegetables are very plentiful. Holly and Mistleto now reach the market in large quantities. *E. H. R., Covent Garden, December 4, 1912.*

GARDENING APPOINTMENTS.

Mr. David Armstrong, for the past 3½ years Foreman at Riccarton Gardens, Midlothian, as Gardener to J. A. Macconochie-Welwood, Esq., Kirknewton House, Midlothian.

Mr. A. W. Mowl, for the past 3 years Gardener to Victor Edelstein, Esq., Oaklands, Bradford, as Gardener to F. Winnington, Esq., Stanford Court, Worcester.

Mr. E. Knowles, for many years Gardener to the late Alderman R. Clough, Beechclippe House, Keighley, as Gardener to Sir Prince Smith, Bart., Southburn, Driffield. (Thanks for donation of 1s. for R.G.O.F.—Eds.)

Mr. F. P. Dickson, previously Gardener at White Lodge, Richmond Park, Surrey, as Gardener to Sir Offley Wakeman, Bart., Yeaton-Peverey, Shrewsbury. (Thanks for donation of 2s. 6d. for R.G.O.F.—Eds.)

Mr. J. Gilbert, for the past 17 years Gardener to Captain Warner, Langton Hall, Market Harboro', as Gardener to C. B. Warner, Esq., Kepwick Hall, Northallerton, Yorkshire.

Mr. E. Percival, for the past 4 years Gardener to Sir John A. Miller, Bart., Heywood Westbury, Wiltshire, as Head Gardener to the Count Conrad, Hockberg, Croydon Hall, Washford, Somerset.

Mr. H. Pritchard, for the past 18 months Foreman to Lady Hickman, Wightwick, Wolverhampton, as Gardener at the same place. (Thanks for 1s. for R.G.O.F.—Eds.)

Mr. R. Ivison, for the past 16 months Gardener at Orton Hall, Westmorland, and previously for 5 years at Naworth Castle, Carlisle, as Gardener to G. O. Sandys, Esq., Graythwaithe Hall, Newby Bridge, Ulverston, Lancashire.

Mr. P. A. Barnes, late Foreman at Bifrons Park, Canterbury, Kent, The Vyne, Oakley Hall, Hampshire, and Rood Ashton Park, Wiltshire, as Gardener to Sir J. A. Miller, Bart., Heywood House, Westbury, Wiltshire. (Thanks for 2s. for the R.G.O.F. box.—Eds.)

Mr. George Haig, for 22 years at Garvald Gardens, Dolphinton, as Gardener to F. Menteith Ogilvie, Esq., Barcaldine, Ledaig, Argyllshire.

Mr. Alex. Chalmers, for 14 years at Haggerston Castle, as Gardener to Mrs. Woddrop, Garvald, Dolphinton.

SCHEDULE RECEIVED.

National Rose Society's first spring Rose show to be held on Thursday, May 1, 1913, in the Royal Horticultural Hall, Vincent Square, Westminster. Secretary, Edward Mawley, Rosebank, Berkhamsted.

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending November 30, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather.*—A very unstable condition prevailed throughout generally; there was much cloud with frequent rain, while late in the week a considerable amount of snow fell over a large area in the north and some localities in the south. On the afternoon of the 27th thunder occurred at Jersey and Guernsey.

The *temperature* was below the average very generally; in Scotland the deficit was as much as 5° or 6°. The highest of the maxima were recorded at most stations on the 25th or 26th, and ranged from 57° in the Midland Counties and Ireland N. to 52° in Scotland N. The absolute minima were extremely low in Scotland and the North of England, and were recorded on the 29th and 30th. At West Linton the thermometer on the latter date descended to 1°, at Balmoral, Kilmarnock, and Newton Rigg to 6°, at Cally, Gatehouse, to 7°, and to below 15° in several other localities. Over Ireland and the southern half of England the values ranged from 18° in Ireland N. to 23° in England S.E., and to 35° in the English Channel. The lowest grass readings recorded were 5° at West Linton, 3° at Newton Rigg, 0° (zero) at Balmoral and Worksop, and 4° at Aspatria. The temperature of the soil at the depth of 1 foot was very generally above the normal, and except at some places in the north-east of England, and Aberystwyth, it was also above it at the depth of 4 feet.

The *mean temperature of the sea.*—On nearly all parts of the coast the water was warmer than during the corresponding week of last year, and in most places its temperature was above the average. The means for the week varied from about 51·5° on the extreme south-west coast of England and 51° at Seafield to a little above 41° at Cromarty and Scarborough.

The *rainfall* was considerably in excess of the average in nearly all districts. Falls of more than an inch occurred at some Scottish and Welsh stations early in the week, the highest figures being 1·5 inch at Glasgow on the 24th, 1·6 inch at Bettws-y-Coed on the 25th, and 1·3 inch at Stornoway on the 26th. At Buxton and Worksop the depth of snow on the 29th was 6 inches, and at Rothesay on the 30th 7 inches. At Wick on the 29th the snow yielded, when melted, 0·93 inch of water in the gauge.

The *bright sunshine* did not differ materially from the normal except in Scotland E., when there was a rather considerable excess. The percentage of the possible duration ranged from 11 in Scotland N., and 14 in Ireland N. to 24 in England S.W. and 28 in Scotland E.

THE WEATHER IN WEST HERTS.

Week ending December 4.

A cold week.—This was, on the whole, a cold week, both during the daytime and at night. On the coldest day the highest temperature in the thermometer screen was only 34°, and on the coldest night the exposed thermometer registered 17° of frost—the greatest cold since the beginning of February. The ground is at the present time 3° colder at 2 feet deep and 1° colder at 1 foot deep than is seasonable. Rain fell on four days, to the total depth of three-quarters of an inch. On two days there were slight falls of snow. During the week 3¼ gallons of rain-water came through both the bare soil percolation gauge, and also through that on which short grass is growing. The sun shone on an average for 1 hour 14 minutes a day, which is a quarter of an hour a day short of the mean duration for the same period of the year. The 2nd inst. was a windy day, and in the windiest hour the mean velocity rose to 17 miles—direction west, but during the rest of the week light airs alone prevailed. The average amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by 7 per cent.

November.

About average in temperature and rainfall, and singularly gloomy.—This was a month of variable temperature. In fact, there were three distinct periods of cold weather and two of warm weather during the course of it. Taken as a whole the temperature was about average. On the warmest day the highest reading in the thermometer screen was 56°, and on the coldest night the exposed thermometer registered 17° of frost. Although somewhat low these extreme readings are nothing very unusual for November. Rain fell on 14 days, and to the total depth of 2⅓ inches, which is about a quarter of an inch below the average for the month. A few flakes of snow fell on two days. The sun shone on an average for 1 hour 10 minutes a day, which is 40 minutes a day short of the mean daily duration for the month—making this, with two exceptions, the most gloomy November I have yet recorded here—that is to say since 1886. On 13 days no sunshine at all was recorded. The wind, taking the month as a whole, was of about average strength. In the windiest hour the mean velocity amounted to 20 miles—direction west. For only 10 hours was the direction of the wind any point between north and east. The average amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by one per cent.

The Autumn.

Remarkably cold, rather dry, and exceptionally sunless.—This proved a cold autumn, indeed, with one exception the coldest autumn for 25 years. September was very cold, October cold, and November of average temperature. The total rainfall, taking the three months as a whole, was rather below the autumn average. The sun shone on an average for 2 hours 51 minutes a day, which is 24 minutes a day short of the mean duration for the quarter. In the last 18 years there has been only one other autumn as sunless.

Our Underground Water Supply.

Since the winter half of the drainage year began in October the total rainfall has fallen short of the average for the same period in the previous 56 years by three-quarters of an inch, which is equivalent to a loss of 17,870 gallons on each acre in this district. At the same time last year there was an excess of 1,130 gallons per acre. *E. M., Berkhamsted, December 4, 1912.*

ANSWERS TO CORRESPONDENTS.

⁂ *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.*

BOOKS: *Reader.* The *Garden Vade Mecum* is the least valuable of John Abercromby's many books, and may be purchased for a few pence.—*Subscriber. The Garden Beautiful,* by W. Robinson. To be obtained from our publishing department, 7s. 11d. post free.—*A. J. F., Spa. Chrysanthemums,* by Thomas Stevenson (Present-Day Gardening Series). Obtainable from our publishing department, price 1s. 9d., free by post.

BULBS DISEASED: *Enquirer.* The bulbs are injured by the Botrytis fungus, which causes "Lily disease." The injury is superficial, and would not prevent the plant from blooming. It would be well to mix a little powdered sulphur with the soil.

CARNATION: *B. C.* It is impossible for us to determine what is wrong with the plant, as you have sent the flower only. As you suspect eelworm to be the cause, you should examine the roots to see if nodules or warts are present, as these are a sure indication of eelworm. If the foliage appears diseased, send some of the leaves for examination.

CARNATION LEAVES: *E. H. E.* The red spots are caused by the punctures of aphides or mites.

CARNATION PRINCESS OF WALES: *Malmaison, Ireland.* This variety is a rich form of the Pink "Malmaison." When exhibited at one of the Temple Shows it was specially admired by Queen Alexandra, then Princess of Wales, and it received its name from this circumstance.

CHART FOR GREENHOUSE THERMOMETER: *L. & C.* Write to Messrs. Negretti & Zambra, Holborn Viaduct, London.

CHRYSANTHEMUMS OUT-OF-DOORS: *Beginner.* To obtain good blooms of Chrysanthemums out-of-doors, the cuttings should be inserted at any time from now until the end of February. The plants should be grown on in a frame or cool house until April, when they should be removed out-of-doors. They should be planted out in May in well-prepared ground, which need not be heavily manured. The plants should either be pinched or allowed to grow naturally, according to the variety, until the flower-buds appear some time during August, when they should be disbudded to one bloom on each shoot. In certain cases it might be advisable to reduce the number of shoots somewhat to secure flowers of the very best quality. It is sometimes necessary to cover the plants or beds with canvas or tiffany at some distance above the flowers, otherwise the blooms will not open properly. During the summer the plants must not be allowed to suffer from want of water, and the ground should be hoed each week. The following varieties are suitable for the purpose:—Polly, Crimson Polly, Cranford Pink, Framfield Early White, La Pactole, Dolores, Almirante, Touraine, Goacher's Crimson, Bronze Goacher, Countess, Cranfordia, Hector, Normandie, Nina Blick, and Fée Parisienne.

CODLIN MOTH: *W. Q. R., Kirkdale.* A little sacking or hay bands should be placed around the stems in July, about 1 foot from the ground, to prevent the caterpillars from climbing into the trees. The bands should be left on until the winter, or they may be removed at the end of October or in November when fixing the grease bands that are used against the larvæ of the winter moth. Such bands should be burned, for they will contain larvæ. All fruits that have been attacked should be gathered and burnt directly they fall, and before the caterpillars have escaped. Next spring the trees should be sprayed as soon as the blossoms have fallen. The spray generally used is Paris Green, applied at the strength of ½ lb. of Paris Green to 120 gallons of water.

CREOSOTE IN PLANT HOUSES: *F. R.* We are not surprised that plants such as Begonia Gloire de Lorraine and Euphorbia pulcherrima (Poinsettia) were injured after you had sprayed the walls of your glasshouse with strong creosote. The fumes from this material are very destructive of plant life, and there have been cases where plants in flower-beds near newly-made roads of creosoted wood blocks have been entirely destroyed. It will not be safe to use the house for plants until a long period has elapsed. In the meantime, throw the doors and ventilators wide open, so that the fumes may escape. (See *Gard. Chron.* October 1, p. 249.)

FLORAL GUM: *Correspondent.* The following details for the making of floral gum are taken from Quin's *Garden Receipts*: Finest pale-orange shellac broken small, 4 ounces; methylated spirit, 3 ounces; digest in a warm place in a closely-corked bottle until dissolved. The mixture should have the consistency of treacle. Or, borax, 1 ounce; water, ¾ pint; shellac as before, 3 ounces; boil in a closely-covered vessel until dissolved, then evaporate until nearly as thick as treacle. The first gum dries very quickly, the second much more slowly.

GAS TAR FOR DRESSING VINES: *Foreman.* A correspondent, writing in *Gard. Chron.*, January 26, 1907, p. 60, on tar as an insecticide for Vines in winter, gives the following recipe: To one gallon of finely-sifted, dry soil, add half a pint of pure gas-tar (tar varnish should not be used); mix this in an iron pot, and place over a steady fire, adding boiling water sufficient to bring it to the consistency of paint. When cool, the mixture is ready for use.

GRAPES DISEASED: *Correspondent.* The trouble is due to black rot, a fungus disease which has attacked the fruit stalks. During the winter, when the vine is resting, drench every part of it with a solution of sulphate of copper 1 lb. in 25 gallons of water. When the leaves are young, spray the vines with the Bordeaux Mixture at half the usual strength, and again at full strength just before the flowers expand.

HAND BOUQUET OF CHRYSANTHEMUMS: *Exhibitor.* The kind of bouquet is immaterial, as the schedule does not call for either a shower or a bunch arrangement, although competitors in such classes usually exhibit the ordinary or bunch bouquet. The prize is awarded for the most effective and artistic design, and a shower bouquet, if superior, would undoubtedly be placed first. A posy of this nature should be arranged lightly, and the colours of the Chrysanthemums should be selected with great care.

HOLLY: *F. R. S.* It is not unusual for the same Holly tree to bear spiny and spineless leaves. In *Holly, Yew and Box,* a figure on p. 9 shows 16 leaves taken from a single specimen of the common Holly; some of the leaves are very spiny, whilst others have entire margins. The author states that "it is a common thing to find many of the leaves on the mature trees partially or wholly spineless, especially on the upper branches."

JAPANESE CHRYSANTHEMUMS: *Mum.* The following varieties of Japanese Chrysanthemums are suitable for cultivating as specimen plants:—Miss Nellie Pockett (white), W. Duckham (pink), Captain Julyan (pab yellow), William Turner (white), Mrs. R. Luxford (Indian red), C. H. Totty (pink), His Majesty (crimson), Mrs. G. C. Kelly (plum), Mr. L. Thorn (yellow), and W. R. Church (crimson).

NAMES OF FRUITS: *W.* 1, Rymer; 2, Scarlet Nonpareil; 3, King of the Pippins; 4, Winter Ribston; 5, Golden Noble; 6, Comte de Lamy. *H. G. K.* Hollandbury.—*W. K.* 1, Tower of Glamis; 2, Fearn's Pippin; 3, Radford Beauty; 4, Bramley's Seedling; 5, Castle Major; 6, Pear White Doyenné.—*O. W.* 1, Golden Noble; 2, Peasgood's Nonesuch; 3, Norfolk Stone Pippin; 4, Cox's Pomona; 5, Lord Derby; 6, Reinette de Caux, syn. Dutch Mignonne; 7, under proper size.—*T. A. S.* 1, Tower of Glamis; 2, Dumelow's Seedling (Wellington); 3, ditto; 4, Lord Burghley; 1, Pear Baronne de Mello; 2, decayed.—*Eltham.* Pears, 1, decayed; 2, no specimen received; 3, Glou Morceau; Apples, 1, Dumelow's Seedling (Wellington); 2 and 3, no fruits; 4, Northern Greening; 5, Emperor Alexander.—*H. C.* 1, Groom's Princess Royal (syn. Matthew's Eliza); 2, Beurré d'Anjou; 3, Comte de Lamy.—*Cestrian.* 1, Dredge's Fame; 2, Old Nonpareil; 3, Gravenstein; 4, Lemon Pippin.

NAMES OF PLANTS: *Cardiff.* Nerine crispa.—

special value).—*F. F.* 1, Sophronitis cernua; 2, Oncidium pubes; 3, O. barbatum; 4, Cœlogyne flaccida.—*Glen.* 1, Dendrobium Phalænopsis; 2, Cypripedium Leeanum; 3, Dendrobium formosum giganteum.—*W. H. P.* 1, Chlorophytum elatum variegatum; 2, Selaginella caulescens; 3, S. Kraussiana; 4, S. cæsia; 5, S. Braunii.

ONTARIO: *Y. J. H.* The address of the Ontario Government Agent is 163, Strand, London.

PELARGONIUMS DYING: *A. H.* The injury is caused by Botrytis, which was present in the plant from which the cuttings were taken. There is no cure.

POTATOS: *W. B.* It is impossible to name varieties of Potatos from tubers only.

SEED OF ECHIUM WILDPRETII: *C. W. Anderson.* You will probably be able to obtain seeds of Echium Wildpretii from Mr. Wildpret, Teneriffe.

SOIL PESTS AND INORGANIC MANURES: *G. R.* To destroy eelworms, wireworms and slugs, all vacant ground should be heavily dressed with fresh gas-lime (½ cwt. to the square rod) as soon as possible. This should be allowed to lie on the surface of the ground for about six weeks, and then forked into the soil, mixing it thoroughly. If the dressing is delayed until the spring, only one-half of the quantity of gas-lime should be used, and several weeks must elapse before the ground is planted or sown with seeds, as the sulphur compounds in the fresh gas-lime are deadly to all life. Land which carries crops should be baited with Potatos and Carrots, which must be frequently inspected, and the worms and slugs killed. The roots should be buried just under the surface, and, for convenience in finding them, it is a good plan to first thrust a stick into each. Slugs may also be easily trapped by laying Cabbage leaves, bran-mash or moist oatmeal near the plants they attack. The pests may be easily exterminated by the use of carbon bisulphide, but great care must be taken in handling this highly-inflammable substance, which is also very poisonous. Make a series of small holes in the ground at intervals of about 2 feet, and 9 inches deep, and carefully pour 1 ounce of the bisulphide into each hole. Immediately cover the holes, and the vapour will permeate the soil, killing all insects and larvæ. Sulphate of ammonia is an artificial nitrogenous manure, obtained largely as a by-product of gas making, and, like all nitrogenous manures, has the effect of producing luxuriant foliage and growth. So that its use for crops which yield flowers and fruit should be confined to applications in the early stages of their growth. Cabbages, Asparagus, Celery, Seakale and Rhubarb may profitably be dressed with sulphate of ammonia. It may be mixed with superphosphate of lime, and applied in the spring, but it should never be brought into contact with basic slag, or the ammonia it contains will be liberated and given off as a gas. To obtain full value for the use of sulphate of ammonia, there should be sufficient chalk in the soil to convert the sulphate into carbonate of ammonia, in which form it is a plant food. Kainit consists of sulphate of magnesium, chloride of potassium, and water. Its chief value is as an economical form of potash manure. Muriate of potash contains nearly four times as much potash, but kainit is very much cheaper, and usually answers equally well. Kainit may be safely applied in the autumn and winter. Potash is essential for the production of high quality in flowers and fruit, and although all good garden soils contain sufficient potash for the needs of most plants, the application of kainit is usually beneficial. Horn shavings are useful for incorporating with the soil where permanent crops, such as fruit trees and lawn grass are to be grown, as they contain nitrogen, and yield it slowly, but unless the horn shavings can be bought very cheaply we should prefer to use crushed bones.

THE MARKET FRUIT GARDEN.

NOVEMBER, nearly up to its end, proved a highly favourable month for fruit planting throughout the greater part of the country. My own record shows only one considerable fall of rain, a little over a quarter of an inch, before the 25th, when and afterwards the downfall was somewhat heavy. My total up to the 24th inclusive was only 0.80 in. Only on two occasions before the 24th was the land so wet as to interrupt planting, and even then the delay lasted in each case no more than a day. For the remainder of the month the soil was too wet for any operations in arable orchards; but work was found for the men when rain held off in the digging of a portion of an orchard which has been in grass for six years. The month ended with a fall of snow and a severe frost.

Soil Sterilisation in Orchards.

Properly conducted experiments in the sterilisation of soils in orchards are greatly to be desired, partly with the object of ascertaining whether the process destroys insect pests hibernating in the land, and partly to ascertain whether there is sufficient fertilising effect to pay for the considerable expense. It is also desirable to learn which of the numerous sterilisers would be cheapest to use in an effective quantity. The cost of one advertised steriliser, in the quantity recommended, would be £10 per acre! This, of course, is prohibitive. Another would cost only 28s. per acre. A friend tells me of a fruit-grower who has applied 4 cwts. per acre of naphthaline to destroy insect pests, and says that much benefit has resulted. This would cost about 27s. an acre. I tried naphthaline and flowers of sulphur separately, at the rate of fully 2 cwts. per acre, on a piece of land being prepared for winter Lettuces. The applications were made before the digging, and the Lettuces were planted three days later. One object was to ascertain whether either or both of the sterilisers would kill slugs in the soil. Neither had the slightest effect in this direction, apparently, as three-fourths of the Lettuces had been devoured by slugs. A gardener has used for several years carbide of calcium to destroy woolly aphis on the roots of trees, and to kill wireworm and other grubs, with great success, he says. I have not been able to ascertain who sells this substance, or what its price is. Dr. Russell, in his lecture in connection with the recent National Chrysanthemum Conference, named formaldehyde, pyridene, and calcium sulphide as the most successful chemicals for soil sterilisation, though inferior to steam in most trials. Steam is out of the question in orchards, though used in hothouses, and there is a confusing multiplicity of chemicals for selection, while Dr. Russell says that time is needed to prove which is the best. If he will ascertain which effective steriliser is the cheapest, he will confer a benefit upon all who desire to try experiments. But there is one other point to consider. Will the best of sterilisers produce as good an effect as its value in manures? Moreover, some American experiments have proved that only in soils well stocked with organic matter was there any increase of fertility from sterilisation, and that the process in numerous trials reduced the fertility of soils deficient in organic matter.

Underrated Apples.

There appears to be a great want of discrimination among retail fruiterers as to the comparative merits of different varieties of dessert Apples. While such poorly-flavoured varieties as King of the Pippins and Worcester Pearmain are market favourites, Allington Pippin and Gascoyne's Scarlet Seedling are neglected, and sell only at the prices of the best cookers. Now, it is true that Allington Pippin is more acid than most consumers deem desirable, if eaten soon after it is gathered. But, if allowed to hang on the tree until fully ripe, as it should be—and it is not a variety given to dropping prematurely—it is sweet and of a pleasantly-spicy flavour after being kept until November. Excepting Cox's Orange Pippin, I do not know of any Apple Grown extensively for market, and in season in November and December, which in flavour and beauty excels Allington Pippin. Gascoyne's Scarlet Seedling, again, is not at its best shortly after being gathered. It is then somewhat rough in texture, and for that reason is less pleasant to eat than many other dessert varieties. In November, however, its texture is perfect, and it is thoroughly deserving of a high place as a table Apple. These two varieties are among the few which improve in flavour by long keeping. We have so few good dessert Apples suitable for commercial culture which will keep up to Christmas or longer that the unwarranted prejudice against Allington Pippin and Gascoyne's Scarlet Seedling is much to be regretted. The former variety has been extensively planted in Kent, and it is one of the healthiest and most productive of dessert varieties. I am informed that it is in favour in the West of England; but it is not so in London at present.

Baddow Pippin.

This variety, otherwise known as D'Arcy Spice Pippin, appears only to be grown extensively in parts of Essex. In my soil it neither grows nor fruits well, and possibly the reason why it is not at all commonly grown for market is that it does not generally give satisfaction. In Essex the variety grows and fruits well, and it is one of the very best of dessert Apples. For a late keeper I should rank it next to Cox's Orange Pippin, and I believe it keeps much later in the season. It does not lose flavour by keeping as do some other choice late varieties, such, for example, as Duke of Devonshire and Mannington's Pearmain. The two latter are very nice up to the last, but lose much of their spicy flavour, particularly if they are not allowed to hang on the trees until quite late in the autumn. That is a point of great importance in relation to most late Apples. But the worst of it is that where only two or three varieties are left on the trees until long after others have been gathered, birds play havoc with them.

Loss from Keeping Apples.

Last season late Apples paid handsomely for keeping until December or later. This season, on the other hand, there has been a heavy loss from keeping the fruit, owing partly to extensive rotting and partly to the glut of American and Canadian Apples in the markets having kept prices from rising. Last season great advantage was derived from keeping Lane's Prince Albert, Bramley's Seedling, Newton Wonder, and Dumelow's Seedling until January or February, when they made high prices. Possibly they might do likewise this season if they would keep. But I had to begin to market Lane's Prince Albert in the latter part of November as they were rotting extensively. Prices were no better than they were a month earlier, when the bulk of sound Apples was much greater. Even Bramley's Seedling will not keep longer than the present time without considerable loss from rotting. Bismarcks are keeping better, while Newton Wonder and Dumelow's Seedling, as usual, keep best of all.

Apples off Grass Land.

Although, on the whole, the disadvantages of growing Apples in grass—even after they are seven or eight years from the planting—are so great that I have had much reason to regret having let a part of one orchard go to grass, there are, nevertheless, some compensations. One is that the fruit is much more highly coloured in grass than in arable orchards, and another is that it keeps much longer. The three varieties named above as keeping well this season were grown on grass land. Small proportions of my Lane's Prince Albert and Bramley's Seedling were also from grass land, and these would have kept until January probably if they had been stored by themselves, which was not the case. Similarly some Cox's Orange Pippins, off grass, which were stored separately from those from arable land, kept well after the others had begun to rot extensively.

AN OBJECT LESSON IN GRASS-LAND FRUIT CULTURE.

That the partial compensations for growing Apples in grass are not sufficient to balance the disadvantages in my case will have been gathered from the statement made in the first paragraph of this article, to the effect that the grass land is being dug. The soil is a lightish loam over a subsoil of sand, and possibly this explains why the trees have suffered severely since grass was allowed to grow around them in consequence of the extreme difficulty of keeping it from growing by hoeing. A very striking object lesson has led to the decision that the orchard shall return to its arable condition, and this must now be described. Two years ago some badly cankered trees of King of the Pippins and Stirling Castle were grubbed up, Potatos were grown upon the cleared space in the following season, and the land was replanted in the autumn of last year. The space thus converted to arable land is bordered with Lane's Prince Albert on one side and Worcester Pearmain on the other, both of which varieties had become stunted and unhealthy after grass had grown around them. In less than two years the outside rows of these two varieties, although more than half their roots must have been still under grass last summer, showed a wonderful recovery in vigour. The trees in these two rows had made more vigorous shoots, showed larger and greener leaves and more of them, and bore more numerous and larger fruits than the trees in the adjoining rows which were entirely in grass. It is true that the ploughed piece of land was manured for the Potato crop; but the trees still in grass also had a heavy dressing of farmyard manure, and the grass when cut has always been left on the ground. The striking recovery in the trees in the two rows, therefore, must have been due mainly to parts of their roots being in arable land. This, at any rate, is my conclusion, and therefore the grass land is being dug at great expense. Some big trees of such strongly-growing varieties as Bramley's Seedling and Warner's King have withstood the trial of being in grass comparatively well; but Cox's Orange Pippin, Allington Pippin, and two or three other varieties have suffered as badly as Lane's Prince Albert, and worse than Worcester Pearmain. *A Southern Grower.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA DUPREANA "THE DELL" VARIETY.

THIS noble hybrid (see fig. 193, p. 451) between C. Warneri and C. Warscewiczii is remarkable for its excellence in size, form and colour. Both parents are numbered amongst the showiest of large-flowered Cattleyas, and an examination of the illustration will show that their characteristics are transmitted to the hybrid. The form, and especially the shape of the lip, is of C. Warneri, but the influence of C. Warscewiczii appears plainly in the bright-yellow colour. The sepals and petals are of a deep rose, the lip ruby-crimson, with a pale-lilac margin and gold lines from the base. This hybrid was shown by Baron Bruno Schröder, The Dell, Englefield Green (gr. Mr. J. E. Shill), at the Holland House Show of the Royal Horticultural Society on July 2, 1912, when the Orchid Committee gave it a First-class Certificate.

SPIRANTHES ROMANZOVIANA.

I READ with interest Mr. Webster's remarks on this pretty Irish Orchid (see p. 367). At intervals we read of its extremely local appearance or disappearance. We have here in quantity two species of Spiranthes growing in open, wet meadows, and the flowers can be gathered by hundreds some seasons, but, from careful observation, I have concluded that the flowers are produced biennially. Last year, after a very thorough search, we found but five plants in bloom of Spiranthes cernua; this season the spikes could be seen in hundreds, also those of S. gracilis, which is much the prettier plant of the two. These Orchids flower very late in the summer (the end of September or early in October), and it is surprising that they ripen seeds. It is well known that many Orchids are weakened by flowering even under the best conditions, and it is fair to assume that so small a plant as Spiranthes Romanzoviana might take a year or more to recuperate. We mow the meadows where the plants grow, or the flowers would never be visible. At flowering time there are no leaves to be seen, only a few leafy bracts on the stem. The common name here is "Ladies' Tresses," and the fragrance of a few spikes is equal to that of Epigæa repens. I would be pleased to send Mr. Webster a few roots another year; I am not aware that either species has been cultivated in Britain. *E. O. Orpet, Lake Forest, Illinois, U.S.A.*

NEW ORCHID LITERATURE.

THE eighth number of the second series of the *Bulletin du Jardin Botanique de Buitenzorg* is wholly from the pen of Dr. J. J. Smith, and it is almost entirely devoted to Orchids. Foremost is a discussion of the claims of Cirrhopetalum to generic rank, as separable from Bulbophyllum. Orchidologists have differed on this point from the time of Lindley, Reichenbach and Blume down to the present day. Lindley himself, who founded Cirrhopetalum in 1824, was well aware of the close relationship to Bulbophyllum. Blume and Reichenbach reduced Cirrhopetalum to Bulbophyllum, though the latter writer subsequently described some species in the *Gardeners' Chronicle* under the generic name of Cirrhopetalum; but, as he used to say himself, he was ambitious of providing names acceptable to both horticulturists and botanists! Bentham and Hooker retained both genera, while pointing out that there were species somewhat intermediate in character. Pfitzer restored Cirrhopetalum to generic rank, and Schlechter has followed him in a recent contribution to Orchidology. Now, Dr. J. J. Smith states that he is fully convinced that Reichenbach's view is the correct one, and, accordingly, transfers about 60 species of Cirrhopetalum separately by name to Bulbophyllum. Kränzlin and Rolfe, who have probably examined more living species than any other two botanists, agree in retaining Cirrhopetalum. I do not propose traversing Dr. Smith's arguments, but it is exceedingly doubtful whether we shall ever reach his ideal that all genera should be definable by decided characters. In spite of divergences of opinion, Cirrhopetalum has come to stay, and, considering that families, genera and species are the issue of individual appraisements of the value of various characters, the matter has not the scientific importance that some would attach to it.

Dr. Smith makes some other generic alterations, among them the reduction of Glossorhyncha and Giulianettia to Glomera, resulting in nearly 40 new combinations of names. Schlechter recently restored Gaudichaud's Cadetia, generally regarded as a section of Dendrobium, to generic rank, and Dr. Smith renames about a score of Schlechter's species under Dendrobium. In the same way, Cyphochilus of Schlechter is reduced to Appendicula. We do not pretend to criticise these changes, which may be perfectly justifiable; we record them.

Dr. Smith describes a number of new Orchids, the most remarkable of which is Dendrobium macroporum, of imposing vegetative proportions.

The rest of this part of the Bulletin is taken up with the description of some interesting New Guinea Ericaceæ, from elevations up to about 11,000 feet, belonging to the genera Rhododendron, Vaccinium and Dimorphanthera. It is noteworthy that some of these Ericaceæ occur at no greater elevation than 500 feet. *W. B. H.*

FOREIGN CORRESPONDENCE.

MUSSAENDA SANDERIANA.

IT is stated in the issue of the *Gardeners' Chronicle* for September 21 last, that Mussaenda Sanderiana requires a stove temperature, but I think that such a statement is likely to cause disappointment. I found the plant on the Tranniuh Plateau in Laos, French Indo-China, at a height of from 3,000 to 4,000 feet, where it grows on the outskirts of woods, in the company of Brambles, Wild Roses, Oaks and so forth.

On the plateau, during the months of December, January and February, hoar frosts are common; sometimes it actually freezes to the extent that water in very shallow pools is covered in the morning with a very thin sheet of ice. Curiously enough, these frosts do not seem to do any damage to the vegetation, and although the nights may be chilly, there is always bright sunshine during the day. Of course, at such a height, even in the hottest part of the year, the temperature is never of that hot and steamy kind found in the tropics at low altitudes or sea level.

Intending cultivators would do well to bear this in mind, and not keep the plant in too hot and steamy an atmosphere. At the same time, it wants plenty of light and all the sunshine available. The best proof of what I say lies in the fact that in Singapore the plant has, at least until quite recently, never flowered. Singapore is evidently too hot for it; it just grows and grows, but it does not flower, whilst Mussaenda erythrophylla, which is found in Africa at sea level, seems to revel in the equatorial heat of Singapore, and flowers all the year round. There are many species of more or less beautiful Mussaendas found all over the East, but they mostly grow in the hot, steamy lowlands, and they generally are of such unwieldy dimensions as to make the successful cultivation of them a hopeless task. When I first saw Mussaenda Sanderiana, it struck me at once not only as the finest white Mussaenda I had seen so far, but also as the only one which might be amenable to cultivation and also worth cultivating. The plants were—in March—just masses of dazzling white, a sight marvellous to behold, and I am certain, if well cultivated, the plant will amply repay all the care and trouble bestowed upon it. *W. Micholitz, Batavia, Java.*

BARON VON MUËLLER.

The presidential address delivered by Mr. J. H. Maiden to the Royal Society of New South Wales is referred to elsewhere (see p. 451). We reproduce here the interesting account which the president gives of the personality of that remarkable man and botanist, Baron von Muëller :—

Nothing other than a tombstone has been instituted to commemorate Baron von Muëller. As a working botanist, I still think that the memorial suggested in my 1897 address is necessary, viz., a complete list of his works, with bibliographic annotations. The list should be in strict chronological order, with a botanically classified supplement. Such a list would find a place on the work-table of every student of Australian plants, and would go far to keep his memory green. The value of such a publication would be greatly enhanced if there were added to it reprints of some of his papers in obscure or rare serials; at present they are lost to most of us.

One of his executors frequently announced his intention of writing a life of the Baron, but he probably realised that he had not the necessary technical knowledge, as he died without accomplishing anything. Meantime Mr. C. A. Topp, a competent authority, during a visit to England, [illegible] as to the encouragement he would receive in writing a life, and abandoned the idea. The probability is now that a full life of Muëller will never be written.

A well-informed life of this remarkable personality would have been very interesting, but the reputation of this great botanist is not dependent on an extraneous circumstance like this. His reputation rests on his published works, and any steps taken with the view of rendering his works more available and more complete, will enhance that reputation.

Personally I think Australia is poorer through no memoir of him as a man having been published. I will leave aside the question of a publication concerning him as a botanist for the present. The late Dr. A. W. Howitt had, and the venerable Mr. Panton, late Police Magistrate of Melbourne, has, innumerable reminiscences of the man who was invariably known as "The Baron." Mr. Panton is one of our best authorities on Australian geography and exploration, and on these subjects Muëller was intensely interested.

He was fond of homage from the younger men. For some years business and private affairs took me frequently to Melbourne, and I always paid my respects to him, except once, when I was making a very brief stay and I was full of business. To my horror, he and his chum, the late Sir Frederick McCoy, bore down on me in Collins Street, and the Baron gave me a good talking to. I had never made such a hole in my manners before, and on the next occasion of my visit to him, perhaps in the way of heaping coals of fire, he paid me the unusual compliment of seeing me into the old St. Kilda bus, and this is how he looked.

He was dressed in a rusty suit of black, with dress coat, the trousers very much too short, showing much blue-grey woollen stocking, while his feet were shod with sabots. Round his neck were several folds of muffler, made of Angora wool, with the ends hanging down. The whole surmounted by a chimney-pot hat of unfashionable model, which had been brushed the wrong way. So long as he had clothes on, the cut or the age of them never entered into his head. He was the pink of courtesy, and sometimes it was difficult not to smile a little at him.

This Angora scarf was historical, and was one of several that had been made from wool that Count de Castelnau, French Consul-General at Melbourne in the 'sixties, gave him. The Count was interested in acclimatisation matters, and certain Angora goats introduced into Victoria turned out very fine animals. An admirer of the Baron had the wool made into mufflers for him, and this pleased him very much, for he was interested in all good works, his attention being by no means confined to botany.

On one occasion I had visited the Baron, and, as usual, had, after a visit of two hours, been unable to get a word in edgeways. As I rose to leave, he noticed that I was recovering from a cold, and, before I could clearly comprehend, he unrolled his Angora scarf from his own neck and quickly rolled it round mine. As he did this he said, "You know I am an M.D." (so he was, honoris causa), and I thoroughly enjoyed the joke. When I got a little distance from the "baronial castle" (as it was playfully called), I removed the scarf, and returned it from Sydney, washed and folded, with grateful thanks. It came to me again by return of post with a letter of mild remonstrance. I am sure you will excuse these brief personal sketches, which are typical of the man.

He was one of the most charitable and unselfish men I ever met, and for many years he was in a chronic state of impecuniosity because he could never resist an appeal for help, while botanical expenses which might have been a charge against the public funds were paid out of his own pocket to a large amount. So he told me many a time. He was a bachelor, and his personal expenditure was of the most modest description—everything went to science and charity.

On two occasions he thought about getting married. Once things went so far as getting the wedding presents, and one of them, a clock, is in the Melbourne herbarium to this day. I think it was well that the wedding never came off. He could not possibly have found time for his wife's company, and it would not have been fair to put her into competition with, say, a new Eucalypt.

Some of his idiosyncrasies were most amusing. If he barked, which he did now and then, there was no bite. He was the quaintest and most picturesque figure I have ever known amongst Australian scientific men.

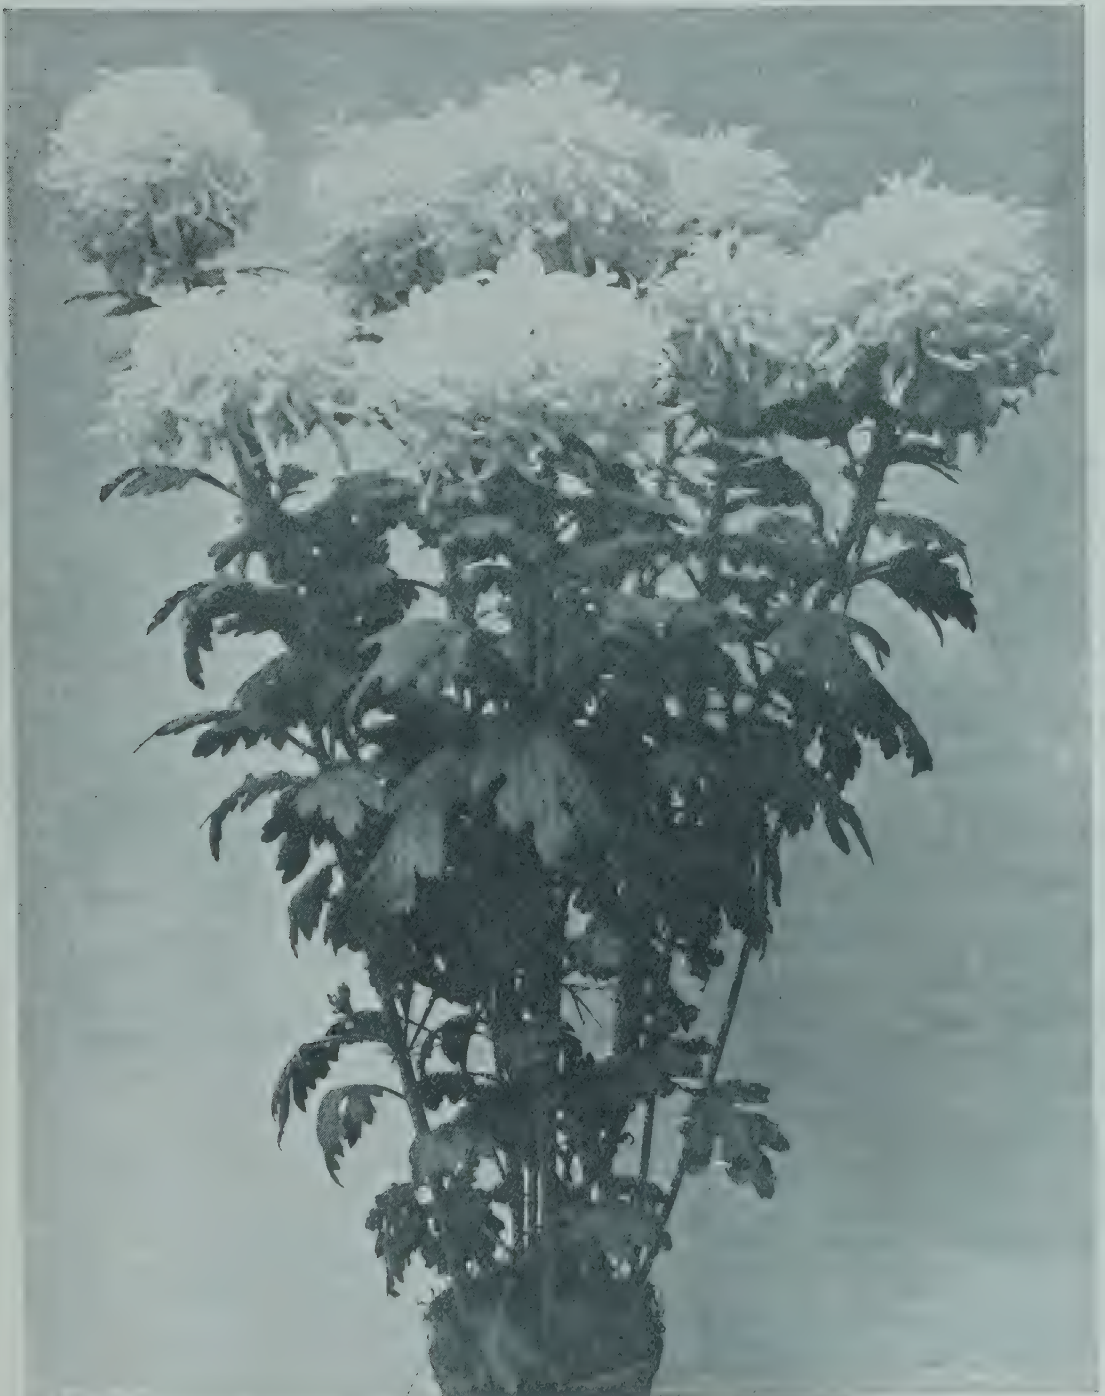

Fig. 188.—CHRYSANTHEMUM MRS. SWINBURNE, AS EXHIBITED BY COL. LOCKWOOD, M.P.
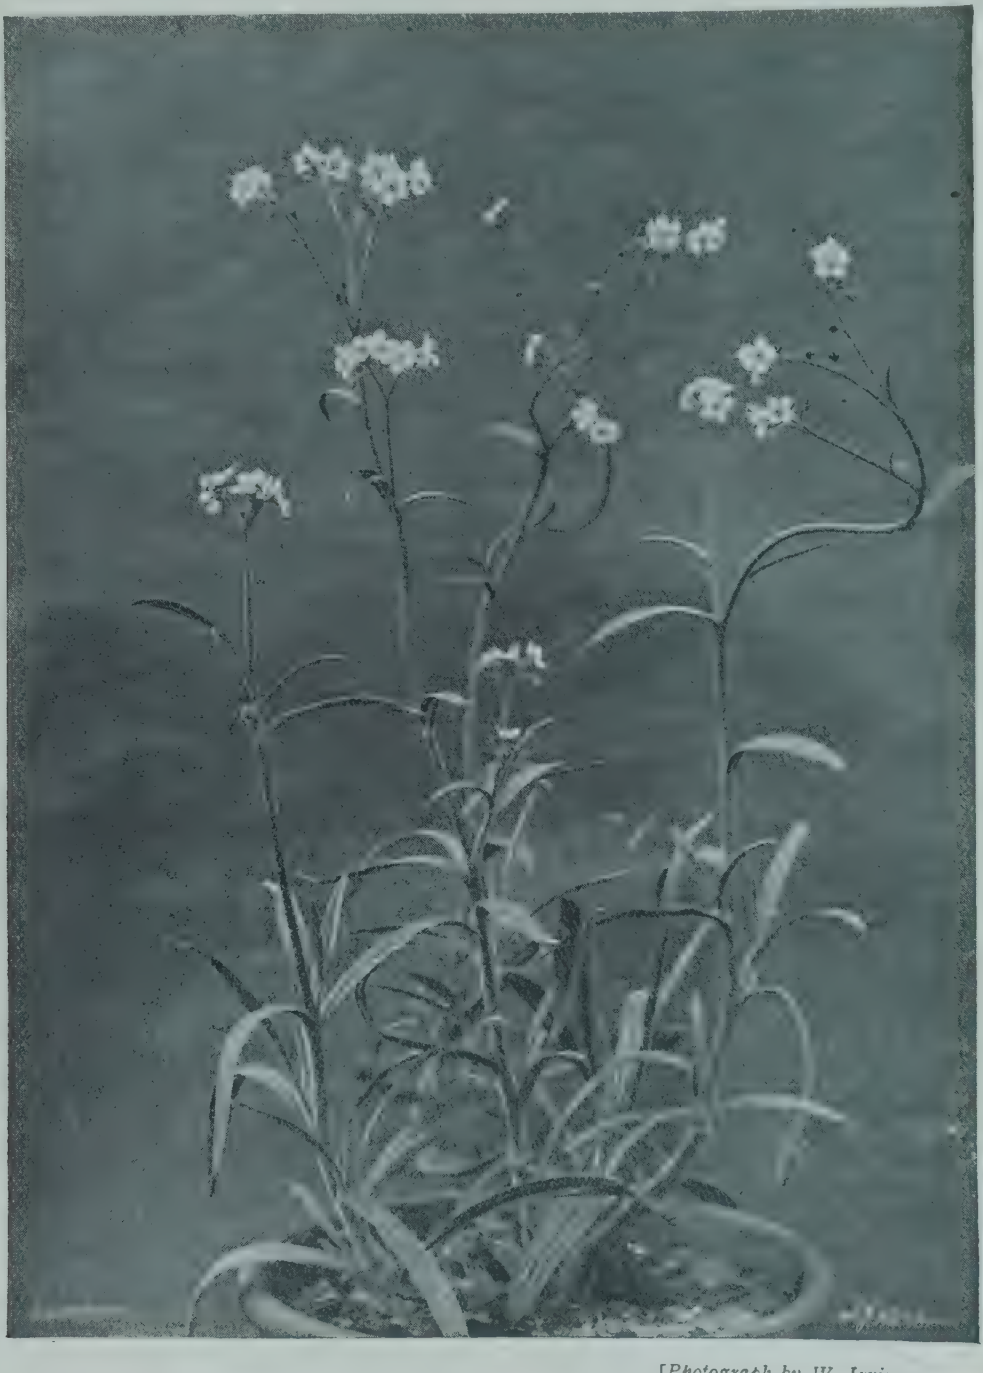
(R.H.S. Cultural Commendation, December 8.)

CHRYSANTHEMUM MRS. SWINBURNE.

The Chrysanthemum plant illustrated in fig. 188 is one of a large number exhibited at the meeting of the Royal Horticultural Society on the 3rd inst. by Colonel Lockwood, M.P., Bishop's Hall, Romford (gr. Mr. G. Cradduck). The largest specimen bore 11 fine flowers and one bud, and was only 2 feet high. There appeared to be some difference of opinion as to the variety, which was not known to Mr. Cradduck, and was declared by some to be Maud Jefferies; it may possibly prove to be a sport, as it appeared with Moneymaker. The pots were only 4½ inches in diameter.

TREATMENT OF LAWN-TENNIS COURTS.

Although lawn-tennis is now largely played throughout the year, it is essentially a summer game. Hence reference in December to grass courts will be thought by some to be out of place; others, however (and we are all more or less interested in what has become, since 1874, a national game), will not consider such comments as untimely as bear upon the management and preparation of the grass for the coming season. Without a doubt, much has been accomplished in the way of weeding and so forth during the past month, but in many instances concentration in this work has led to the neglect of many other cares.



[*Photograph by W. Irving.*

Fig. 189.—Cynoglossum cœruleum: a new species from East Africa.

Nets which should be in the hands of the repairer have been put aside and forgotten; the posts need a coat of varnish; the club chairs and tables should be overhauled, the groundsman's machine well oiled and put away for the winter. Much trouble, too, can be saved by a little forethought.

As a labour-saving instrument the lawn-tennis marker is held to be invaluable; whitewash and linseed oil, made into a hot soup, well mixed, and rubbed into the ground with a brush is, however, much more lasting, and will, in a normal season, last two or three weeks.

Every vestige of the light whitewash lines put on by the marker has by that time disappeared. Some of the little iron T's have been lost or broken; but the careful man has an admirable substitute in wooden pegs. These should be preferably of Oak or some other hard wood; they should be driven into the ground an inch below the surface at the junction of the lines; a small hole will be left above each peg, and on re-marking the ground the corners will be easily found.

Less than 40 years ago, when Lord John Hervey played on his croquet ground in Suffolk, lawn-tennis was scarcely known, and, without a doubt, it owes its prominence to lovers of tennis on the hard court, who realised the advantages of the former as a summer game. Then came the evolution. New rules and regulations came in turn, with the necessity for level courts on a hard and well-drained surface, in which road metal, gravel, a depth of rich soil, the best of grass seeds, or the finest turf that could be procured formed essential parts.

But while sinkage on courts so made is almost imperceptible, on other courts laid out on natural soil depression in the ground is of frequent occurrence, and this should receive the attention of the groundsman in November. Armed with a line or a straight piece of wood and a spirit level, he will see at a glance the sunken places. The turf, sodden by recent rain, can be easily raised to an inch above the level by the use of a garden fork. In places the sod must be removed with the turfing iron, a thin sifting of soil being introduced between the surface and the turf and left until the spring.

By this simple method much can be accomplished; but at the end of every season the turf, on the serving lines, needs to be relaid, and to some small clubs the cost is prohibitive. This is also work which should be done when the ground is thoroughly soaked and before severe frost. Cutting, hauling and laying the sod all mean heavy items in the annual expenditure; these, however, may be greatly reduced, for on every club ground there are, between the courts, patches of turf, which may be removed to the service lines, and replaced by well-worn sod; while a full yard in width may be removed from either side of the net, the soil made and sown with seed or the turf replaced by some of inferior quality without detracting from the value of the court. The careful man, however, who has an eye to the future goes one better. He overlooks nothing, and, should there be waste patches or disused corners of rough grass under his control, they are dug up and tilled with grass seeds of a mixture of Crested Dogstail, Hare's Fescue, Sheep's Fescue, other grasses, and a sprinkling of Clover, according to the nature of the soil, thus in the future saving considerable expense to the club.

Other grievances with which the groundsman has to contend are worms and even moles, while impoverished grass becomes Moss-grown. And this brings one on to the question of manure. Soot, sulphates, phosphates, ammonia and common salt appeal to one as being easily used and productive of certain, quick results. These, however good they may be, merely stimulate, and it is questionable, where possible, if it would not be more advantageous to hark back to the old-time methods of our fathers and use sheep—a flock of ewes! These, if borrowed from a farmer for a day or so in November and enclosed securely, would not only benefit the land, producing richer growth, but, moving continually, would solidify the ground. Farmyard manure from fatting stock, evenly spread, and raked off the ground early in spring, would also have a lasting effect. Such matters as these, however, must be left to the discretion of the secretary of the club, without whose supervision throughout the autumnal as well as the early months of the year no lawn-tennis club can hope to prosper. *Harry Danes.*

CYNOGLOSSUM CŒRULEUM.

Seven species of Cynoglossum are found in Central Africa, but C. cœruleum is probably the only one in cultivation, and, judging from dried specimens in the Kew Herbarium, it is the most attractive. The Cynoglossums generally are not suitable plants for cultivation, although certain of the Himalayan species, including C. nervosum and C. Wallichii, have numerous ornamental blue flowers. Plants of C. cœruleum flowered in Messrs. Barr & Sons' nursery this autumn; they were raised from seeds received from British East Africa. The growth is erect and neat, about 12 inches to 18 inches high, and furnished with narrow leaves, the longest of which are about 3 inches. The bright-blue flowers are produced very freely in panicled cymes, and may be likened to those of the Forget-me-not. The species has a somewhat wide distribution, for it is found also in Uganda and Abyssinia. A variety, with broader leaves, named Johnstonii, is found on Mount Kilimanjaro, at an elevation of 6000 feet. In common with all the members of its family, the plant is easily raised from seed. It is not certain whether the plant is hardy, but it is a native of fairly high eleva-

CORSICA.

(Concluded from p. 425.)

A Journey Through the Island.

Twice a week, a steamer leaves Marseilles for Ajaccio. The crossing takes from 12 to 14 hours. It is difficult to imagine a more beautiful sight than that presented by the Bay of Ajaccio on a bright winter morning. The sea is like a sheet of glass, which, at the rising of the sun, reflects every possible colour; the blues and greens so delicately graded that it is impossible to tell where one begins and the other ends. As the light morning mist disperses, the wooded hills emerge, and the mountain peaks tower over the landscape, the rising sun painting their summits the most beautiful colours—violet, red, pink, until at last, the sun having reached its zenith, the pure white snow-covered tops dazzle the sight. Between the sea and mountains occasional glimpses are caught of the town with its innumerable, snowy-white buildings.

Ajaccio is sheltered from cold winds by a barrier of mountains clothed with Olive trees; and the town enjoys an ideal climate during at least eight months of the year. Rain seldom falls in the daytime, but, thanks to the proximity of the mountains, a good deal comes down in the night. At the time of the birth of Napoleon, Ajaccio was a mere village, with the narrowest of streets, across which hung lines of drying linen—red and yellow, according to the Italian fashion. A new town has sprung up since then, with wide avenues and large squares planted with Phœnix dactylifera, P. canariensis, Schinus Molle, Grevillea robusta, Ficus, and other plants. Several monuments have been erected to the great emperor, and it is possible to visit his first home. This latter is very unpretending—merely the *nest* of the eagle; his true home was on the battlefields of Europe.

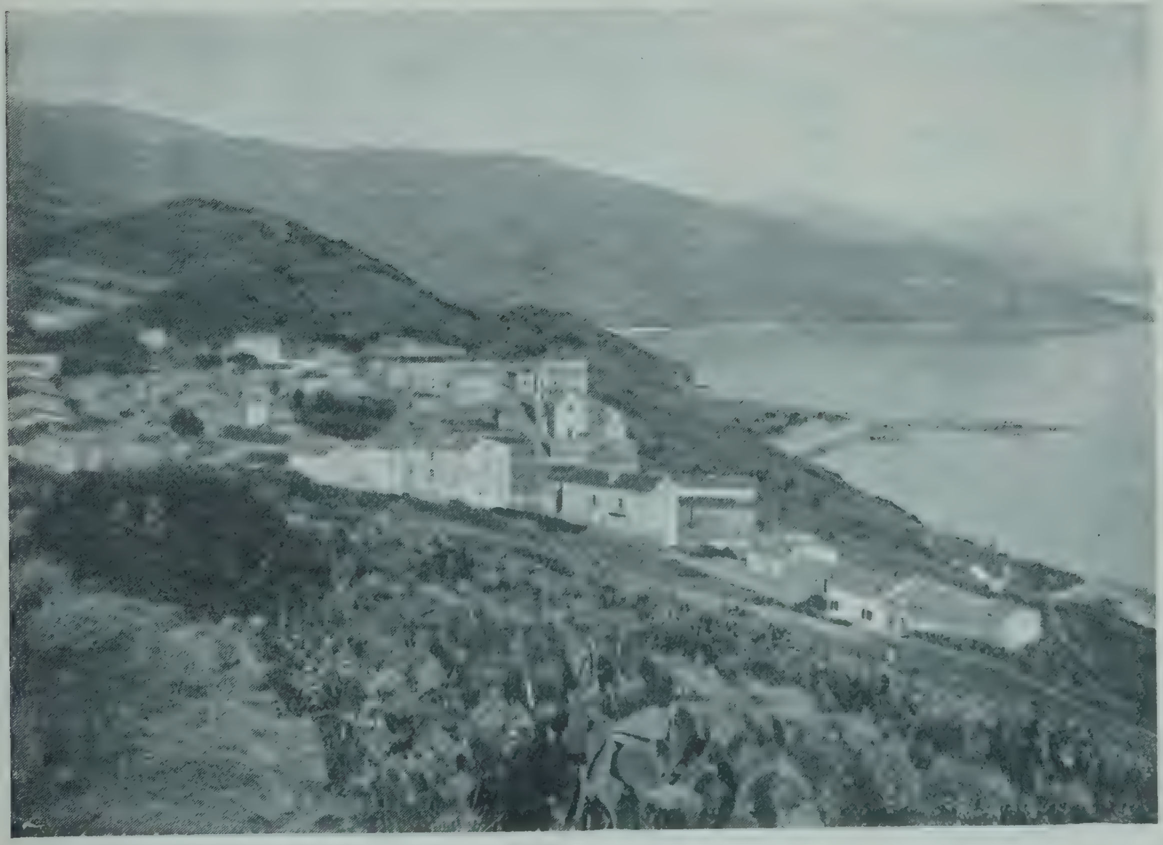


Fig. 190.—View of Carghese, Corsica.

Ajaccio is full of interest for the botanist, especially from December to June. Beside the "maquis" already described, there are huge bushes of Opuntia ficus indica, which present a most striking appearance and often attain a height of 10 to 12 feet; trails of Smilax aspera are fond of climbing up the stems, and give the plant a curious aspect. The flowers of the Opuntias are gorgeous, and are followed by the sweet Pear-like fruits (prickly Pears). The taller-growing bushes are frequently broken by the wind; but the prostrate stems curl themselves round into the shape of a concave vessel, and so retain and hold all available moisture.

The stems nourished in this manner soon throw out fresh roots, from which new stems spring: the plant thus indicating the method by which it may best be propagated. It has often been found that if the joints are planted upright, they fail to grow or root; but if they are laid flat on the ground, they invariably grow and flourish.

Another Opuntia is also naturalised. Its joints are smaller than those of O. ficus indica, and it has strong and very abundant spines. Its fruits are not edible, and it makes a first-class hedging shrub. Unfortunately I have been unable to ascertain its name.

Oxalis Lybrica = O. cernua is very luxuriant, and becomes extemely troublesome where any sort of cultivation is attempted. Fifty years ago, Ajaccio was the only place in Europe where it was to be found; but since then, it has become disseminated all over the French and Italian Riviera. During the winter its clover-shaped, brilliant green leaves make a vivid groundwork, over which the long-stemmed umbels of bright yellow flowers hang in profusion. The flowers shut at night, but open widely with the first rays of the rising sun. This species is said to be seedless; it is propagated by means of a rhizome, which grows underground and produces numbers of small bulbs.

Early in winter, the bright flowers of Crocus minimus are everywhere to be seen, while Scilla italica and S. amoena hide their little bells under the leaves of the Cistus. Cyclamen repandum is also very common. In moist places, Arisarum vulgare may be observed in December and January, with its curiously shaped spathes; a less common Aroïd—Arum muscivorum—is found in one or two places round Ajaccio. Under the Olive trees, Narcissus Tazetta covers large areas of ground; and Lathyrus Clymenum, L. angulatus, and Psoralea bituminosa flower profusely along the roadsides. Romulea Columnæ is found in a few dry, sandy places, where it forms a thick carpet; it is a small, somewhat scarce, bulbous plant, with thin, dark leaves and blue flowers, starlike in form. With it are often associated R. Revelieri and R. Requienii.

With the spring, several Orchids make their appearance. Among others may be mentioned Barlia longibracteata, Ophrys Bertolinii, Orchis papilionacea, Serapias Lingua, S. cordigera, Limodorum abortivum, and Aceras densiflora. When ascending Mount Pozzo at the beginning of May, we have come across wide areas covered with Orchids in profusion. In June, when vegetation begins to suffer from the heat, Pancratium illyricum and P. maritimum produce their handsome umbels of Lily-shaped flowers; the bulbs are of large size, and deeply rooted, which makes it difficult to get a good specimen to carry away.

Ajaccio is the capital of Corsica, and is perhaps the pleasantest spot in an island which is full of beauty and interest. Travelling southwards from Ajaccio by steamer, we land first at Bonifacio. The town is built on a high cliff of limestone (the only limestone in the whole island), which has been bored out into long grottos and caves by the action of the sea. Even under the town itself, there are long tunnels which have been slowly fretted out by the restless waves. Vegetation is scarce, and the want of trees gives to the landscape a sad and depressing aspect. Many interesting plants, however, are to be found growing between the bare rocks. At a short distance from the semaphore, in a deserted, sandy place, Morisia hypogaea forms a carpet of yellow flowers, the colour both brighter and more intense than can be obtained in cultivation. Near the shore Mesembryanthemum nodiflorum and M. crystallinum may be found in large quantities; and where a little soil has been formed, Helichrysum angustifolium, Cineraria maritima, Matthiola incana and Anchusa italica are to be seen. On the road-sides, plants of the Leguminosæ family are predominant, including several species of Lathyrus, Vicia and Lotus.

Looking southwards from Bonifacio, the dark-fringed shores of Sardinia are to be seen plainly on the horizon. From Bonifacio back to Ajaccio one may travel overland, and it is a very interesting journey, though terribly slow. Means of locomotion are hardly up-to-date; they consist of an old stage coach drawn by three mules over what is called merely by the barest courtesy a "road." A pleasant excursion may be made from Ajaccio to the "Calanches de Piana"; the distance is about 70 miles altogether, and can be done in one day in a motorcar. The road runs through the Greek colony of Carghese (fig. 190) follows the coast for a time, and then climbs a steep slope through the sweet-scented "maquis." Higher up, the road passes between high rocks; and suddenly, after a sharp turn, a huge mass of rock is confronted, seemingly lying right across the way. This is known as the "Levrier" (or Greyhound) and marks the entrance to the "Calanches." The road now passes through a wonderful chaos of mountain and rock; huge masses of stone are piled one on the top of the other by a perfect miracle of balance; they are chiefly composed of orthoclase, and under the blazing sun they seem to be of a dazzlingly bright pink colour. The road runs through these rocks for about two miles, and then, with the suddenness of a revelation, the intensely blue Mediterranean bursts upon the vision, lying like a sea of glass. This is the Golfe de Porto (see fig. 191). It is impossible to describe with the least adequacy the exquisite beauty of the view; the azure bay, surrounded by rocks of the most delicate shades of rose, makes one of the loveliest pictures which Nature has produced. It is difficult to bring one's mind to bear upon the details of the flora, which is scanty enough; we note rapidly Pinus maritima, several varieties of Cistus, Cytisus triflorus, and Dianthus virgineus.

To reach the highlands of Corsica, it is necessary to use the railway between Ajaccio and Bastia. The line follows the Vallée de la Gravonne; and Corsican railways are sufficiently leisurely to allow plenty of time to admire the picturesque route, and to observe the flora; indeed, no plant growing within reasonable distance need be missed! On the lower slopes, Iris Pseudacorus grows very tall. A few hundred feet above sea level Helleborus corsicus shows its prickly leaves, crowned in winter with large flowers.

After travelling for 2½ hours we arrive at Vizzavona, only 35 miles from Ajaccio, but 2,400 feet above the sea. No sooner have we left the train, than we enter one of the finest forests in the island, entirely composed of Pinus Laricio, the Corsican Pine. The trees grow thickly, and are tall and straight; the forest is the property of the State, and is perfectly kept. Several paths have been cut across the best parts, and Vizzavona is like a sylvan park. As soon as the winter snow has melted, Crocus minimus covers the ground with its bright flowers, and here and there clumps of Helleborus corsicus and bushes of Daphne laureola are to be seen. Vizzavona is used as a summer retreat by well-to-do Corsicans; several hotels and villas have been erected on the slopes of Monte d'Oro. This mountain—one of the highest in Corsica—possesses several rare plants, such as Aquilegia Barnardii Draba Loiseleuri, Lepidium humifusum, Helichrysum frigidum and Linaria hepaticæfolia. The Monte d'Oro is full of interest for the botanist, and also the ordinary tourist; and the same may be said of all the mountains in Corsica. The reward is well worth the trouble, and the journey is one which is not likely to be regretted. *C. L. Degoy.*

THE SEED SUPPLY.

(See also article on p. 450.)

The seed supply for the present season may be described as deficient generally, for the few cases in which normal quantities of good seeds are to be found in the markets scarcely affect the general yields.

Moreover, whilst last year the crops were also very light, the quality uncommonly high and the percentage of germination extraordinary, this season there is no such compensation, for much loss has been experienced in the cleaning and grading, and the germinating qualities may prove to be moderate and disappointing.

Speaking first of flower seeds, it may be said that, at the commencement, seedling plants of perennials and biennials were extremely scarce in the autumn of 1911. These plants stood the winter well, but during the flowering season (April and May) the want of rain, the prevalence of cold, with two or three sharp frosts, and the drying winds, checked the flowering and seeding of such plants as Polyanthus, Primroses, Auriculas, and Sweet Williams.

Canterbury Bells likewise suffered from the same cause, and the supply is deficient, although somewhat better than last year.

Myosotis was injured by the cold winds of April and May, and an indifferent crop resulted.

Wallflowers fared rather better, and produced a fair crop of good seed, but, owing to the shortage of plants, the seed available is of a limited quantity.

The continuous wet of August, followed by a dry September, caused plants of Antirrhinums to bloom freely a second time, and this fact somewhat destroyed the bright outlook of a good crop; still the supply is moderately good.

Taking annuals collectively, the crops are light to medium. A few kinds, such as Candytuft, Gypsophila, and Nemesia, are good, but many other popular annuals are scarce.

At one time Sweet Peas promised to be a very good crop, but they finished one of the worst on record. The crops in America and other countries were as bad, or worse, and the supply will not be equal to the demand.

Mignonette produced good crops in certain districts, but in other localities the yield was deficient. However, as a whole the supply is of medium quantity.

China Asters suffered from the wet of July and August, more especially the early varieties, which were then in bloom. Medium and late-flowering varieties, improving greatly during the favourable weather in September, produced a fair crop. The percentage of germination, however, cannot be expected to reach a high standard, and this remark may apply to most flower seeds this year.

Heavy rains during August destroyed the bright prospects of a heavy crop of Nasturtium. The plants grew to leaf too freely, instead of throwing an abundance of flowers. The supply is moderate.

It is, however, among the late-seeding annuals that the greatest shortages are felt, such as Ageratum, Calliopsis, Godetia, Larkspur, Lobelia, Marigold, Scabious, and Stock. These were extremely late in blooming, and they were suddenly checked by the frosts of early October.

Turning to the vegetable crops, Beet plants were unable to get a good start owing to the spring drought, and later were affected by excessive wet. The seed supply is deficient.

Some fields of Brussels Sprouts were badly blighted owing to the drought, but there is a fair supply of seeds.

Cabbage and similar crops encountered unsuitable conditions throughout the season. Great difficulty was experienced in getting the plants through the ground in the autumn of 1911, and they were very small. As a result many failed to "run" in the spring. Those that did were badly affected by the drought and much blighted. The seed supply is deficient.

The Carrot crop was fairly good as a rule, although many fields were destroyed entirely by the heavy rains of the late summer.

The great majority of Celery plants failed to stand the winter. Soup Celery is an abnormal price this year, and Celery seed generally is scarce.

The Leek supply is very deficient owing to the lack of plants. It was extremely difficult to raise plants during the summer of 1911.

In most cases Lettuces failed completely. The plants were healthy, and promised full crops up to the middle of July, but cold and damp weather set in just as they were in full bloom, with the consequent ruin of the crop.

The acreage planted with Onions was much below the average, owing to the shortness of bulbs, but the crop was fairly satisfactory and the supply of seed is moderate.

Parsley was one of the worst crops; as the plants were so small when planted out in the autumn, the majority of them failed to "run" to seed.

The Parsnip crop, usually one of the most reliable, was this year practically a failure. The small quantity of seed harvested was of poor quality. There is a certain amount of foreign seed, but it is doubtful whether the produce of such seed will be appreciated by English growers.

At one time it was feared that the Radish crop would be a failure, as the seed failed to germinate owing to the dry weather which set in immediately after it was sown. It came up very unevenly, and the plants made no headway for a long time. Rains fell just in time to save it, but the crop was extremely late.

Spinach was the best crop of the year.

Fig. 191.—Golfe de Porto, Corsica.

Turnips suffered very severely from the drought and subsequent blight, and were a very light crop.

Swede, like Turnip, is a very poor supply.

Mangold Wurzel was a fair crop, but many fields suffered severely from the spring drought, and failed to recover.

After several seasons of short crops, when prices have been high, many people are tempted to grow inferior stocks for seed purposes, procured from cheap sources. This is bad alike for the seedsman and the grower. The seedsman, however, who takes all possible pains, and goes to great expense to produce seeds of high quality from pedigree stocks, has to compete with inferior produce, and the grower who is unfortunate enough to use this bad seed suffers loss and annoyance when his crop is grown. Unfortunately the quality of seeds cannot be judged by the sample, but only by the produce, and if people would bear this in mind they would not be tempted to buy seeds of doubtful origin for a slight difference in price, which is trifling in comparison with the value of the resulting crop. *Correspondent.*

NEW ROSES.—V.

CLIMBING ROSES.

The list of new climbing Roses brought out during the past four years is a long one. The result of my more or less successful experiments is as follows:—

Alexandre Girault (Wich., Barbier, 1908).—The parentage of this Rose makes it attractive—Wichuraiana × Papa Gontier. The Rose is a strong grower, very free flowering, and quite a good garden plant. It is a carmine colour, with a slight tint of orange, but I must admit the shade of colour has been a little disappointing this year. It flowers in mid-season, i.e., about the third week in June. Some give the date of introduction 1907, but I do not think it came much into this country till 1908.

American Pillar (Multi., Conard and Jones Co., 1909).—Taken all round, I incline to think this the best and the most distinct in character of our new climbing Roses. It is a fine strong grower, easily making growth of 12 feet to 15 feet in a season. The bark is a nice light green, and the foliage very thick, glossy and dark green, clothing the plant down to the base like Ivy, and lasting nearly as long. The flowers are single, bright pink in colour, with a white eye and yellow stamens, and are carried in big, solid trusses. They are most decorative, and always attract immediate attention in a stand of garden Roses. This Rose comes into flower about the end of the second week in June, and lasts in flower for about six weeks It seems quite free from mildew and other diseases, and has no faults that I know of. Unfortunately, it has only one flowering season. The laterals from the previous year's growth, which carry the flower bunches, make very long arms, and this should be borne in mind in planting and training, or they may be damaged by the wind.

Fig. 192.—corsica: the village of corte.

Ards Rambler (H.T., A. Dickson & Sons, 1908).—This is a vigorous grower and perpetual, that is, it flowers again in the autumn. In the summer blooming it often gives quite well-shaped flowers of a carmine colour. It makes strong shoots, and may be used either as a pillar Rose or for a big bush, where plenty of room can be given. I do not think it has flowered with me quite so freely as Ards Rover, which I incline to think the best of the three (Ards Rover, Ards Pillar and Ards Rambler). Still, perpetual-flowering climbers are scarce, and down to the present these three Roses constitute a class which is quite distinct.

Ariel (Wich., Paul & Son, 1910).—This beautiful climber was raised as a cross between R. Wichuraiana and Tea Rambler, and may almost be described as a single-flowered Tea Rambler, but it has, I think even more beautiful foliage. Like this Rose, it makes fine, strong, summer shoots, but not all from the base of the plant. The colour is coppery pink, which we have found harmonises very well with Irish Glory. The contrast of flower and beautiful foliage is the attraction of this Rose. It seems quite hardy and free from mildew.

Coquina (Wich., Walsh, 1908).—One of the prettiest, most-useful and most-distinct of the newer Wichuraiana hybrids. It is very effective as a pillar, each bunch arranging itself so as to display its flowers to great advantage, and the plant carries pretty, lightish-green foliage. The flowers are small and rather cup-shaped, of a porcelain pink, shading deeper to the tips of the petals, which have a yellow base. The bunches are fairly large, and last remarkably well. The length of time the plant continues in flower is, however, its strongest point: it comes out late, about the first week of July, is at its best about the 15th, and thence onwards has continued flowering till November. Moreover, this year has shown that it will stand any quantity of rain. The later flowers are not, of course, produced in such quantity as those of the summer, but in decidedly greater quantity than the occasional flowers of Dorothy Perkins. By some accident this pretty and useful little Rose has escaped notice in the N.R.S. *Catalogue*. It is, unfortunately, almost scentless.

Diabolo (Wich., Fauque, 1908).—This Rose has strong, rather upright growth and single flowers of a fine, deep-crimson colour, with conspicuous yellow anthers. It flowers early, about June 10. Its strong point is its handsome colouring, which is unique in its class. It is said to be a cross between Wichuraiana and Xavier Olibo.

Excelsa (Wich., Walsh, 1909).—Another Rose of striking colour, the flowers of Excelsa being of a very bright, light crimson. It is a mid-season Rose, coming into flower between the middle and end of June. We had a pillar of this Rose in front of a large arch of Hiawatha, and when it was first out it quite put Hiawatha in the shade for brightness of colouring, but when they had both been out some little time it was just the other way about, that is, though brighter at first, it loses colour more quickly than Hiawatha. When it was first shown at the Temple from plants grown under glass I remember asking Mr. Paul, "Can we hope to get that colour in the garden?" Well, the answer is, we do get it, but not for very long. Still, it is gorgeous while it lasts. The flowers are double and sweetly scented. I do not know its parentage.

Goldfinch (Multi., Paul & Son, 1908).—This is a seedling from Hélène. It is vigorous, strong and hardy. The buds are deep yellow, opening to creamy-yellow flowers. It is a good and useful climber, with nice, light-green foliage and stems, and makes a good pillar Rose. It is a mid-season climber, opening about the third week in June. I am pleased with this little Rose, which is one of the best yellow climbers at present, but it does not quite show off its flowers as well as it might do. They are best in the bud stage and are fragrant.

Lady Godiva (Wich., Paul & Son, 1908).—This is a pale-blush sport from the well-known Dorothy Perkins, and, I think, down to the present the most beautiful of its sports. The colouring is very soft and pleasing, and it has all the vigour and good qualities of its parents. Christian Curle (Cocker, 1908), slightly more salmon, and Dorothy Dennison (A. Dickson, 1909), shell pink, are so near to this Rose in colour and habit that they ought not to be kept distinct.

Refulgence (Sweet Briar, Wm. Paul, 1908) is hardy and a good grower. The flowers are nearly single and scarlet-crimson in colour. It is the best of its class since Lord Penzance's Sweet Briars came out.

Shower of Gold (Wich., Paul & Son, 1910).—This Rose is said to have been obtained as a cross between Jersey Beauty and Instituteur Sirdey. It has beautiful, glossy, dark-green foliage, which lasts well, and is a most effective feature of the plant. The flowers are small, double, and rather cup-shaped, golden-yellow at first, becoming pale later, but retaining their colour better than most yellow Roses of this type. The trusses of bloom hang downwards in a graceful manner, and look well on the plant. My flowers began to open this year (1912) on June 16. It may thus be put in the mid-season section. It has all the vigour of its parent Jersey Beauty, and is the best yellow Rose of its class at the present time.

Starlight (Multi., Paul & Son, 1908).—This is a single-flowered Rose, with smooth, shiny, almost-thornless stems, and rather large foliage. The flowers are large for their class, white, edged with a soft-violet rose. The petals, however, are a little wanting in substance, and do not stand rain well.

Sylvia (Wich., Wm. Paul & Son, 1911).—This is a pretty little Rose with lemon or creamy-white flowers. The special feature of this Rose is that it is more or less perpetual. I have only had a plant for one year, and, therefore, must write of it with some reserve. The perpetual Multifloras, such as Trier, are inclined to make bushes rather than the rampant-climbing shoots such as we get in Crimson Rambler and Blush Rambler, and it remains to be seen whether this Rose will not be rather of the habit of Trier than Dorothy Perkins. At all events, my plant has not at present made any very long shoots, though it has given a second crop of flowers.

White Dorothy (Wich., B. R. Cant and Paul & Son, 1908) is another climbing sport from

Dorothy Perkins, with white flowers. It has the habit of its parent, and was the best white climbing Wichuraiana at the time of its introduction. Its weakness is a tendency to sport back to the pink colour of its parent. Like its parent, it belongs to the late section. *White Rose.*

(To be continued.)

KEW NOTES.

COTONEASTER ROTUNDIFOLIA.

This Himalayan species is one of the three best Cotoneasters in cultivation. It forms a spreading bush 4 feet to 5 feet high, with rather flattened branches, which, at the present time (November 24), are clothed with roundish, deep-green leaves and quantities of shining red berries. It is worth recording that, though the fruits of this Cotoneaster are large and fleshy, they are generally the last to be touched by the birds. Though the older bushes often lose a few leaves at the ends of the branches, most of the leaves are persistent until early in spring; thus the bush is semi-evergreen. The species may be seen at Kew in a bed by the Orchid houses and in large groups elsewhere in the gardens.

SENECIO CANALIPES.

This South African climber is flowering freely on one of the rafters at the cooler end of the succulent-house. It is the most vigorous of the three climbing species of Senecio, the other two being S. auriculatissimus and S. macroglossus. The heart-shaped leaves are lobed and thick in texture. The rich-yellow flowers, each about ¾ inch in diameter, are arranged in loose, terminal inflorescences. The plant is readily propagated from cuttings and is a vigorous grower. It is a free-flowering plant and unsurpassed as a climber for a cool greenhouse at this season of the year.

LUCULIA GRATISSIMA.

A specimen 12 feet in height of this deliciously-fragrant greenhouse shrub in the large temperate house is covered with blossoms. The delicate flesh-pink flowers are borne in many-flowered terminal cymes. The plant may be propagated by cuttings and seeds. It grows best in a mixture of sandy loam, peat or leaf-mould and coarse sand; the bed or border should be well drained. After the flowering is over, the shoots may need pruning to keep the plants in good shape.

ILEX PERNYI.

The largest specimen at Kew of this new Chinese Holly is fully 6 feet in height. Young plants are comparatively slow in growth, but this specimen has grown well during the past summer; the shoot forming the leader has increased fully 2 feet in height and is stout in proportion. Mr. E. H. Wilson states that the plant forms a tree in Central China 20 feet to 30 feet in height. The habit is close growing. The leaves (see *Gard. Chron.*, January 30, 1909, fig. 41) are deep, shining green, 1 inch to 1½ inch long, armed with two or three pairs of strong spines on the lower halves and one at the apex.

RUBUS GIRALDIANUS, Focke.

This species is one of the most conspicuous of the newer Chinese Brambles planted in the collection near to the pagoda. Its white stems rival the Himalayan R. biflorus for autumn effect, whilst in summer the plant forms an elegant bush some 8 feet or 9 feet high, with attractive pinnate leaves. The young shoots are sometimes 10 feet long, and, branching at the upper half, terminate in graceful arched growths. The old stems should be removed as soon as the fruit is ripe. This work must be done with care, as the white substance on the bark is readily rubbed off. The plant was illustrated in *Gard. Chron.*, March 9, 1912, fig. 61, as an unnamed species. *K.*

The Week's Work.

FRUITS UNDER GLASS.

By E. Harriss, Gardener to Lady Wantage, Lockinge House, Wantage, Berkshire.

Early Peaches.—The temperatures of the houses which were closed early last month may be increased about 5°. During very mild weather the temperature may reach 60° during the day, but it should be 5° lower during the night. If possible, during the early stages of growth, warm the house by means of the pipes which are farthest away from the trees. It will be noticed that red-spider invariably appears first on those parts of the trees which are nearest to the hot-water pipes. In consequence of this, the pipes at the back and front of the house should be regulated by separate valves. Admit air during the forenoon whenever the weather is mild, but close the ventilators before the sun has lost its power. It is beneficial to open the top ventilators slightly at night. Spray the trees with lukewarm rain water on bright mornings, and keep the atmosphere moist by sprinkling the walls and paths in the house as often as necessary. Disbudding may be commenced when the shoots are about 1 inch long. One-third of the buds may be removed at this stage, and they should be taken chiefly from the undersides of the shoots. This work should be spread over several weeks, so that the trees may not receive a check. Always start the work at the top of the trees. Fumigate the house with a nicotine compound before the flowers expand to destroy any aphis that may be present. More than ordinary care is needed to ensure the flowers setting at this time of the year. During this stage the temperature should not fall below 55°. Ventilate the house carefully and keep the temperature as equable as possible. Pollinate the flowers at noon, brushing each flower with a rabbit's tail. Endeavour to set fruits on the upper sides of the shoots. Syringing should be discontinued whilst the trees are in flower, as the flowers set best when the atmosphere is dry.

Second Early Peaches.—The trees should be prepared for forcing early in the New Year. If the pruning, cleansing and tying of the shoots be finished at once, the house may be thrown open for a week or two prior to starting the trees into growth. When the buds show signs of swelling, close the front ventilators if the wind is cold and the weather frosty.

Vines.—Vines intended for planting in the spring should be cut back before the end of the year and the cut surfaces painted with styptic when they are dry. The vines may be plunged in ashes and left outdoors till a week or two before they are required for planting. Young vines which were planted last season should be pruned. The main rods may be cut back to about 2 or 3 feet, or even less, if they have not made satisfactory growth. These vines should not be allowed to fruit until they have grown for another season, and then only lightly. Overcropping young vines is a frequent cause of failure.

THE FLOWER GARDEN.

By J. G. Weston, Gardener to Lady Northcote, Eastwell Park, Kent.

Protecting Plants and Shrubs.—The time has arrived when severe weather may be expected. Therefore, protecting materials should be placed in readiness, but they should not be employed unless absolutely necessary. Chamærops Fortunei, C. humilis, Phormiums and Cordylines are much hardier than is generally believed, but it is well to give them a little protection during times of severe frosts. Do not afford too much covering to these plants, or they may become tender and be liable to injury when they are exposed again in the spring. For some years past I have placed dry Bracken Fern or, in the case of roots, dry leaves around the stems and bases of tender plants, keeping the leaves in position with branches of such evergreens as Rhododendrons and Laurel. Wire-netting may also be employed to prevent the leaves from being blown away by winds, and the netting will be hidden by the evergreens. Tender climbers on walls should be covered with mats or canvas, but these coverings should be removed whenever the weather permits. If dry Bracken and evergreen branches are used, the air will circulate freely about the plants and prevent them becoming tender. Coal-ashes are useful for protecting the roots of certain plants from frost.

Planting Climbers.—The present is a suitable time for planting many of the hardier climbers. Although it is advisable to delay the removal of tender kinds until the spring, the sites for these should be prepared now, so that there may be no delay when planting time arrives. As climbers occupy the ground for a long time, the soil should be well prepared and enriched. In all cases the ground should be trenched deeply; if the subsoil is of inferior quality, it should not be brought to the surface, but it should be well broken up with the spade. Wet ground should be drained. Plenty of decayed manure should be incorporated with the soil at the bottom of the trench, but it must not come in contact with the roots. The plants will be benefited by the manure after they have become established. The majority of climbers thrive in ordinary garden soil, but if the ground is poor, loam should be added before planting. If it is intended to plant peat-loving subjects, such as Lapagerias, the stations should be marked and a suitable compost provided. When planting wall climbers, introduce choice dwarf-growing shrubs at intervals to allow plenty of space at the top of the wall for the stronger-growing subjects, such as Clematis and Roses. Jasminum nudiflorum, Lonicera fragrantissima, and Chimonanthus fragrans should be planted for early blooming. Garrya elliptica is a very attractive wall plant: it produces its grey-green catkins in mid-winter. Magnolias are suitable shrubs for planting against walls, especially M. grandiflora. Spaces should be left for tender climbers, such as Solanum jasminoides, Cobæa scandens, Passifloras, Lophospermum scandens, and Eccremocarpus scaber.

THE ORCHID HOUSES.

By J. Collier, Gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Phaius. — These plants are still growing freely, but from now onwards until the early spring they will require very little water at the roots, provided their surroundings are kept moist: endeavour to keep the compost just moist. P. Cooksonii, P. Norman, P. Marthiæ, and P. amabilis are beautiful hybrids and very floriferous; they require far less room than plants of P. grandifolius and varieties of P. assamicus. Phaio-Calanthe Sanderiana, P.-C. Berryana, P.-C. Arnoldiæ, and P.-C. Colmanæ should be afforded similar treatment to the above. These plants are very subject to attacks of thrip and scale insects, which should be kept in check by sponging the leaves frequently with an insecticide. They should be grown in an intermediate temperature and afforded plenty of fresh air at all times, but they must not be exposed to cold draughts.

Miltonia. — Plants of Miltonia vexillaria and its hybrids are growing freely. An intermediate temperature is suitable for these Orchids, and the compost will not become dry so quickly as in a house where much fire heat is employed. Stand the plants in a light position and allow them to develop steadily. The young leaves frequently adhere to each other, and should be separated by means of the thin part of the handle of a budding knife. A brown, damp-looking, outer sheath at the base of the young growths often clasps the stem so tightly that the roots push upwards inside it instead of growing into the compost. This sheath should be removed in small pieces without causing injury to the plant. The above remarks apply also to M. Blueana, except that a slightly higher temperature should be afforded this plant. M. Roezlii needs a higher temperature and more atmospheric moisture than those mentioned above. The plant is more or less in active growth throughout the year, and the roots should be kept moist at all times. The foliage should be sprayed on all favourable occasions to keep down the attacks of insect pests. M. candida, M. Clowesii, M. Regnellii, M. Bluntii and others of this section should be staged in the intermediate house and kept on the dry side all through the winter.

Phalænopsis.—P. amabilis, P. Sander'ana, P. Schilleriana, P. Stuartiana, and P. leucorrhoda are in flower or developing their flower-spikes. These plants should be watered with great care during the winter, as an excess of moisture at the roots may set up decay in the leaves. The plants should be examined each morning, and if the Sphagnum-moss is dry it should be lightly sprinkled as soon as the temperature rises above 65°. At the same time damp the sides of the receptacles and the roots that are clinging to them with tepid rain-water. Care must be taken that the water does not lodge in the centres of the plant or in the axils of the leaves. The flower-spikes should not be allowed to remain on the plants for long after the flowers are developed or the plants will be weakened and permanently injured. These Orchids should be afforded a light position, but not exposed to direct sunshine. Certain of the green-leaved varieties, such as P. violacea, P. speciosa, P. Luddemanniana, P. Marie, and P. sumatrana are still growing actively, and should be afforded sufficient water to keep the Sphagnum-moss fresh and green. They must also be protected from direct sunshine even at this season. The surroundings of the plants should be damped on both mornings and afternoons, regulating the amount of moisture according to the weather. The bare spaces may be allowed to become dry for a short time during the middle of the day. The night temperature of the house during mild weather should be about 65°, with about 5° increase during the day. On very cold nights, when much fire-heat is necessary, a few degrees lower will suffice, for a close, hot, moist atmosphere is harmful. Admit fresh air to the house without causing cold draughts, opening the top ventilators slightly on the side of the house sheltered from the wind.

PLANTS UNDER GLASS.

By Thomas Stevenson, Gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey.

The Glasshouses.—The roof-glass outside soon becomes covered with soot and dirt in winter, especially in smoky districts, such as the neighbourhood of large towns. This deposit robs the plants of much light, and should be removed on frequent occasions. The glass outside should be wetted by means of the hose, scrubbed with a long-handled brush, similar to that used for cleaning railway carriages, and finally cleansed with a stream of clean water. During the next month or six weeks very little potting will be necessary in the houses, and the opportunity should be taken to give the interiors a thorough cleansing. It is best to empty the house of all the plants, as this will save much time, and prevent the foliage becoming splashed with dirty water. Scrub the paint-work and well wash every part of the house. If red spider, thrip, or mealy bug be present, the walls and woodwork should be syringed with paraffin and water. Opportunity should be taken to limewash the walls and paint the hot-water pipes, but this should be done before the paraffin is applied. When the work is finished, turn on the hot-water valves and open the ventilators for a day or two before introducing the plants again. In the meantime the plants themselves should be overhauled, the leaves sponged, and the pots washed, so that everything will be clean and tidy when the house is rearranged.

The Conservatory.—In most establishments there is a large demand for plants and flowers at Christmas; the conservatory, especially where it adjoins the dwelling-house, should be made as bright as possible at this season. Flowering plants, including Poinsettias, Euphorbias, Richardias, Chrysanthemums in variety, Primulas, Cyclamens, Freesias, Roman Hyacinths, Solanums, Coleus thyrsoideus, and Begonias may be used for indoor decorations, and the embellishment of the conservatory. There will probably be a demand for cut blooms at Christmas, and surplus plants of these subjects in frames and other structures will prove very useful.

Plants in Frames.—Frames are not so dry as plant-houses, and unless they are well furnished with hot-water pipes there is a danger from too much moisture in mild, wet weather. Because of this the plants need to be watered with extreme care. Bedding plants in frames should be examined frequently with a view to removing decaying foliage, as decay soon spreads. Pelargoniums should be afforded plenty of space to keep the growth stocky. Calceolarias, Veronicas, Pentstemons, Antirrhinums, and similar subjects in cold frames should be fully exposed during fine weather by removing the lights entirely. All these plants are well-rooted, and they should be kept as hardy as possible. Under this treatment they will not be so liable to injury during times of severe frost, when extra protection should be afforded them.

THE KITCHEN GARDEN.

By Edwin Beckett, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Spinach.—Last year it was difficult to find a really healthy bed of winter Spinach; but this year the crops have done remarkably well, and promise to yield good supplies. Care should be exercised in the gathering; the largest leaves should be plucked separately, and the younger foliage handled with caution to prevent injury. At intervals, the hoe should be run over the ground between the rows, to break the surface, and enable the rain to be carried away more readily. The perpetual variety of Spinach, though not usually considered to be of a very high quality, is extremely hardy, and most useful in mid-winter. A few good rows will yield a surprisingly large quantity, and this sort should be used during severe weather, in order that the tenderer kind may not be gathered too closely. In case large quantities should be required, and crops show signs of not lasting well into the spring, it is a good plan to sow a few rows at this season in a portable frame on a very gentle hot-bed of leaves. The soil should be made up to within about 8 inches of the glass, and the plants thinned to a reasonable distance while the seedlings are quite young. Careful attention should be paid to watering and ventilation, but all coddling must be avoided.

Rhubarb. — In order to obtain satisfactory results in forcing, the crowns must be permitted a certain period of rest prior to introducing them to heat. It should be remembered that some varieties lend themselves more readily to forcing than others, and these should be selected for the purpose. The roots must be carefully dug up with as large a ball of earth as possible, and placed under a north wall. A little long litter should be strewn over them, and they should then be placed in the desired heat, to succeed the earliest batch. If a new plantation is necessary, the ground should be thoroughly trenched *now* to a good depth, and plenty of good farmyard manure dug in. The surface should then be strewn with a liberal supply of burnt garden refuse, and the ground left fallow until the time of planting.

Seeds.—It is often desirable to perpetuate special strains of certain kinds of vegetables, such as Peas, Beans, and Parsnips. The season has not been favourable for the ripening of seeds; those that have been harvested should be cleaned of rubbish and placed in packets duly labelled. Beans and Peas should be sorted, and small and worthless seeds rejected. Small seeds may be cleaned by passing them through sieves with different-sized mesh. The seed-room should be dry and not too warm. The seeds should be placed either in drawers or on shelves, where they may be handled readily when the time arrives for sowing. It is a suitable time for putting the seed-room in proper order and making alterations that may be an advantage. The old stocks should be examined, and worthless seeds discarded, to make room for the new seeds.

Potatos.—Potatos are best forced in pots or boxes, and if the "sets" are sprouted a commencement may be made. Pots 8 or 10 inches in diameter are the most suitable receptacles. They should be well drained and filled with a light compost, consisting of three parts well-decayed leaf-mould, one part sandy loam free from wireworm, and a sprinkling of soot. The pots should only be filled to three-parts their depth, to allow room for top-dressings after the plants are well advanced in growth. The soil should be made only moderately firm, but it should be well soaked with water. Moisture will not be needed again until the shoots appear above the soil. Place the pots in a moderately warm house; they may be stood under the plant stages if care is taken to prevent water from the plants above dripping on to the soil. Immediately the shoots appear, the plants should be removed to a position near to the roof glass. The temperature should be from 50° to 55°, and the atmosphere moist, but not too damp, as this would result in weak growth. Admit air when the weather is favourable. After a time the weaker shoots should be removed.

Celery. — The plants should be protected whenever the weather is very cold, but they should be exposed directly the frosts have disappeared again. If the soil is heavy, it should be loosened with a fork at the bottom of the ridges, to allow rain-water to pass away freely.

Onions. — The larger bulbs should be examined frequently, as many continued to grow after the ripening stage, owing to the damp weather. Decaying bulbs should be removed at once. Make a small sowing of Onions for use as salad.

Mushrooms.—The Mushroom house should not be kept too warm, but should be damped frequently. When Rhubarb is forced in this structure, slugs may be introduced, and these pests must be sought for and destroyed, or they will damage the young Mushrooms. As soon as the beds arrive in bearing, the covering material should be removed. Make fresh beds as soon as suitable material is available.

THE HARDY FRUIT GARDEN.

By F. Jordan, Gardener to Lady Nunburnholme, Warter Priory, Yorkshire.

Trees from the Nursery.—The nurseryman is often blamed for young fruit trees proving unsatisfactory, whereas the real cause may be something over which he has no control. For instance, injuries or delay suffered in transit, and keeping the roots for too long out of the ground after the trees are delivered are all harmful, and may result in failure. If planting is impossible when the trees are received, owing to the condition of the soil being unsuitable, the roots must receive attention. If the trees are frosted they should be placed in an open shed and well covered with litter until thawed. But, assuming they arrive in favourable weather, the package should be opened at once, and all damaged roots trimmed neatly. If the latter are very dry, they should be immersed in a tank of water, or dipped in stiff puddle for a short time. If the stations have been prepared beforehand, the trees may be planted as soon as the roots are partially dry again. Puddling is preferable at this season to watering, which causes the soil to be wet and cold for a considerable time afterwards. Trees received and planted early in the autumn do not often require these attentions, but those received in February or March, or at any date after the sap has commenced to rise, should always be treated in this manner. Staking is another important operation, for if the trees are not made secure after planting they may make but little progress. If tied loosely, the stems may be chafed through rubbing, but the tying should not be done so tightly that when the soil settles the roots are drawn through the soil.

Labelling.—The proper labelling of fruit trees is an important matter. The small paper tallies attached to the trees by the nurserymen soon perish, and should be replaced by permanent labels directly the planting is finished. It is advisable to make a plan of the plantation, showing the various trees and their names: the plan should be nailed on a board and hung up in the fruit room. Labels made of sheet lead, with the names stamped on them, are very durable. A little white paint smeared into the lettering will show up the names conspicuously. These labels may be made in the garden. But there are numerous other kinds on the market equally as serviceable. If the tallies are attached to the trees with wire, an examination should be made at least once a year to see that the wire is not injuring the bark. Lead wire is pliable, but it does not last so long as ordinary wire. The labels should be placed where they may be seen readily, and those attached to the trees always at about the same height.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

APPOINTMENTS.

MONDAY, DECEMBER 16—
Nat. Chrys. Soc. Executive Com. meet.

TUESDAY, DECEMBER 17—
Royal Hort. Soc. Coms. meet (no exhibition).

WEDNESDAY, DECEMBER 18—
Royal Meteorological Soc. meet.

THURSDAY, DECEMBER 19—Linnean Soc. meet.

Average Mean Temperature for the ensuing week deduced from observations during the last Fifty Years at Greenwich—40·5.

Actual Temperatures:—

London.—*Wednesday, December 11* (6 p.m.) Max. 52°; Min. 46°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, December 12* (10 a.m.): Bar. 29·7°; Temp. 48°; *Weather*—Fine.

Provinces.—*Wednesday, December 11:* Max. 54° Shields Min. 47° Aberdeen.

SALES FOR THE ENSUING WEEK.

MONDAY and WEDNESDAY—
Rose Trees, Shrubs, Lilies and Bulbs, at Stevens's Auction Rooms, 38, King Street, Covent Garden, at 12.30.

MONDAY and FRIDAY—
Dutch Bulbs, Herbaceous and other Plants, at 12; Roses, at 1.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

TUESDAY—
The Greenhouses, Piping, Frames, Lights, Brickwork, &c., at the Nurseries, South Woodford, by Protheroe & Morris, at 12.

WEDNESDAY—
Hardy Bulbs, Perennials and Border Plants, &c., at 12; Palms and Flowering Shrubs, at 5; Special Sale of Roses, at 12.30; at Protheroe & Morris's rooms.
Palms, Azaleas and Rhododendrons, at Stevens's Auction Rooms, at 12.30.

THURSDAY—
Miscellaneous Bulbs and Roots, at 11; 3,316 cases of Japanese Liliums, at 2.30; at Protheroe & Morris's rooms.

Our Almanac. — We shall shortly issue a *Gardeners' Chronicle* Almanac for the year 1913. *In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents, will send us* IMMEDIATE INTIMATION *of all fixtures for the coming year.*

Catalogues and the Seed Supply. Gardeners are just now endeavouring to estimate their seed requirements for next season. The trade catalogues are in course of distribution, and orders will soon have to be despatched. The lists are sometimes made out in such a liberal manner as to satisfy all the desires of the cultivator, but in other cases the most careful consideration is necessary in order to keep the value of the order within the means of the purchaser. Every year the keen gardener feels a very reasonable desire to try a few of the season's novelties, some in the vegetable garden, others in the flower garden, but, unfortunately, the newest varieties, always dearer than standard sorts, are not easily obtainable by those whose annual expenditure on the garden is fixed at a moderate sum. So it is that the

out of a seed order, instead of being the easy matter it seems, is really one of those very difficult tasks that require as much time and thought as can be given them with due regard to other matters.

When we state that we have seen orders that were compiled with extreme care cast aside on reflection for others in which the adjustments seemed to promise to get just a little nearer the ideal it is probable that it will serve to remind many of our readers of experiences within their own recollections. So many variations are possible in an annual seed order for an average garden that probably no two persons would ever draft similar orders for the same garden; tastes differ in regard to desirable kinds, and the views of cultivators do not always agree as to what constitutes a sufficient quantity for a given purpose.

This latter thought leads us to observe that in some cases the means for purchasing a few extra novelties might possibly be saved by reducing the quantities of standard sorts until they represent the minimum that will give satisfaction; for it is to be remembered that unduly thick sowings give but poor results, and it is not good management to have a lot of seeds still unused at the end of the planting season.

We have referred to the difficulties of the seed order, but it must not be thought that the catalogues themselves do not provide liberal compensation. With what pleasure we look forward to them, and how eagerly we turn over the pages during these long, dark evenings. They seem to help us to form ideal garden pictures for the coming season; an illustration here and description there are destined to give us an interest in certain novelties which will last until we ourselves have found in what measure it is possible to realise the promises the catalogue holds out. "Castles in the air" some of the dreams of the long evenings may prove to be, but most of them will materialise, and next year as now the catalogues will quicken our interest as the horticultural heralds of summer.

Poring over the catalogues we are set thinking of whence all the new seeds come, and what conditions favour the production of plentiful harvests of good seeds. We are not able on this occasion to pursue the first question beyond stating that hundreds of acres of land are annually devoted to seed culture in these islands, and many thousands of trained men are engaged in the cultivation, harvesting, and cleaning of the seeds; whilst the machinery used in this latter process is not less ingenious than that employed in any other industry. But in regard to the further question which refers to the conditions favourable to the crops, we know that the principal influences are of a meteorological character. The proportion of dry and rainy weather, of sunshine and cloud—these are the main factors, beyond the selection of site and the exercise of good cultivation, that determine the quantity and quality of the yield. On another page

season in respect to some of the principal crops, both of flower and vegetable seeds, furnished by a correspondent with exceptional means of estimating the supplies. It is a matter for regret that there are great deficiencies to be faced, and it cannot be said, as last year, that compensation is to be found in the superior quality of the seeds.

In the first place, the weather during the winter of 1911-12 was comparatively mild, and the biennial plants were induced to make a certain amount of growth when they should have rested; consequently, severe weather which occurred in April caused serious injury to many kinds, including those which are usually hardy enough in normal conditions. April was followed by a drought which lasted for seven weeks, at a time of the year when rains were needed to induce the seeds of annuals to germinate and favour the planting out of seedling plants. Directly the long drought terminated there commenced a period of frequent rains, accompanied, during the latter part of July and in August, by unseasonable cold, which prevailed at a season when the hottest weather is usually experienced and vegetation is making rapid growth. During this period it was next to impossible to note any progress in growth, but happily September showed some improvement, and owing to the greater amount of sunshine the situation came to present a less serious aspect than threatened. Cool weather, of course, is not injurious to all crops in the same degree, and there are some classes of seeds which did not suffer nearly so much as in the hot summer of 1911.

To sum up, it is the early-flowering plants which seeded most sparingly, and later plants showed a little improvement. The crop of seed Peas was undoubtedly much better in quantity than the harvest produced last year, but there have been heavy losses during the cleaning operation which will reduce the supply of good seeds. The yield of Sweet Peas was extremely poor, and the crops in America and elsewhere were worse even than our own.

There is one matter connected with these successive years of poor crops that has a very serious aspect for the general cultivator, namely, the deterioration of stocks that necessarily follows. If a field of Cabbage or Beetroot, for example, has to pass through a season of extremes of weather, it is only the coarser and sturdier plants that survive. The more delicate plants die, and these latter belong often to the choicer strains, the result being that there is a marked difference between the parent stock seed and the produce. In some cases, also, carefully saved stock seed, the result of years of selection, is irretrievably lost.

All these matters will be in our minds as we peruse the catalogues, with their alluring descriptions and fascinating pictures, and cause us to feel at least some appreciation, and even sympathy, for those who in good seasons and bad contrive to supply us with good seed which shall spring

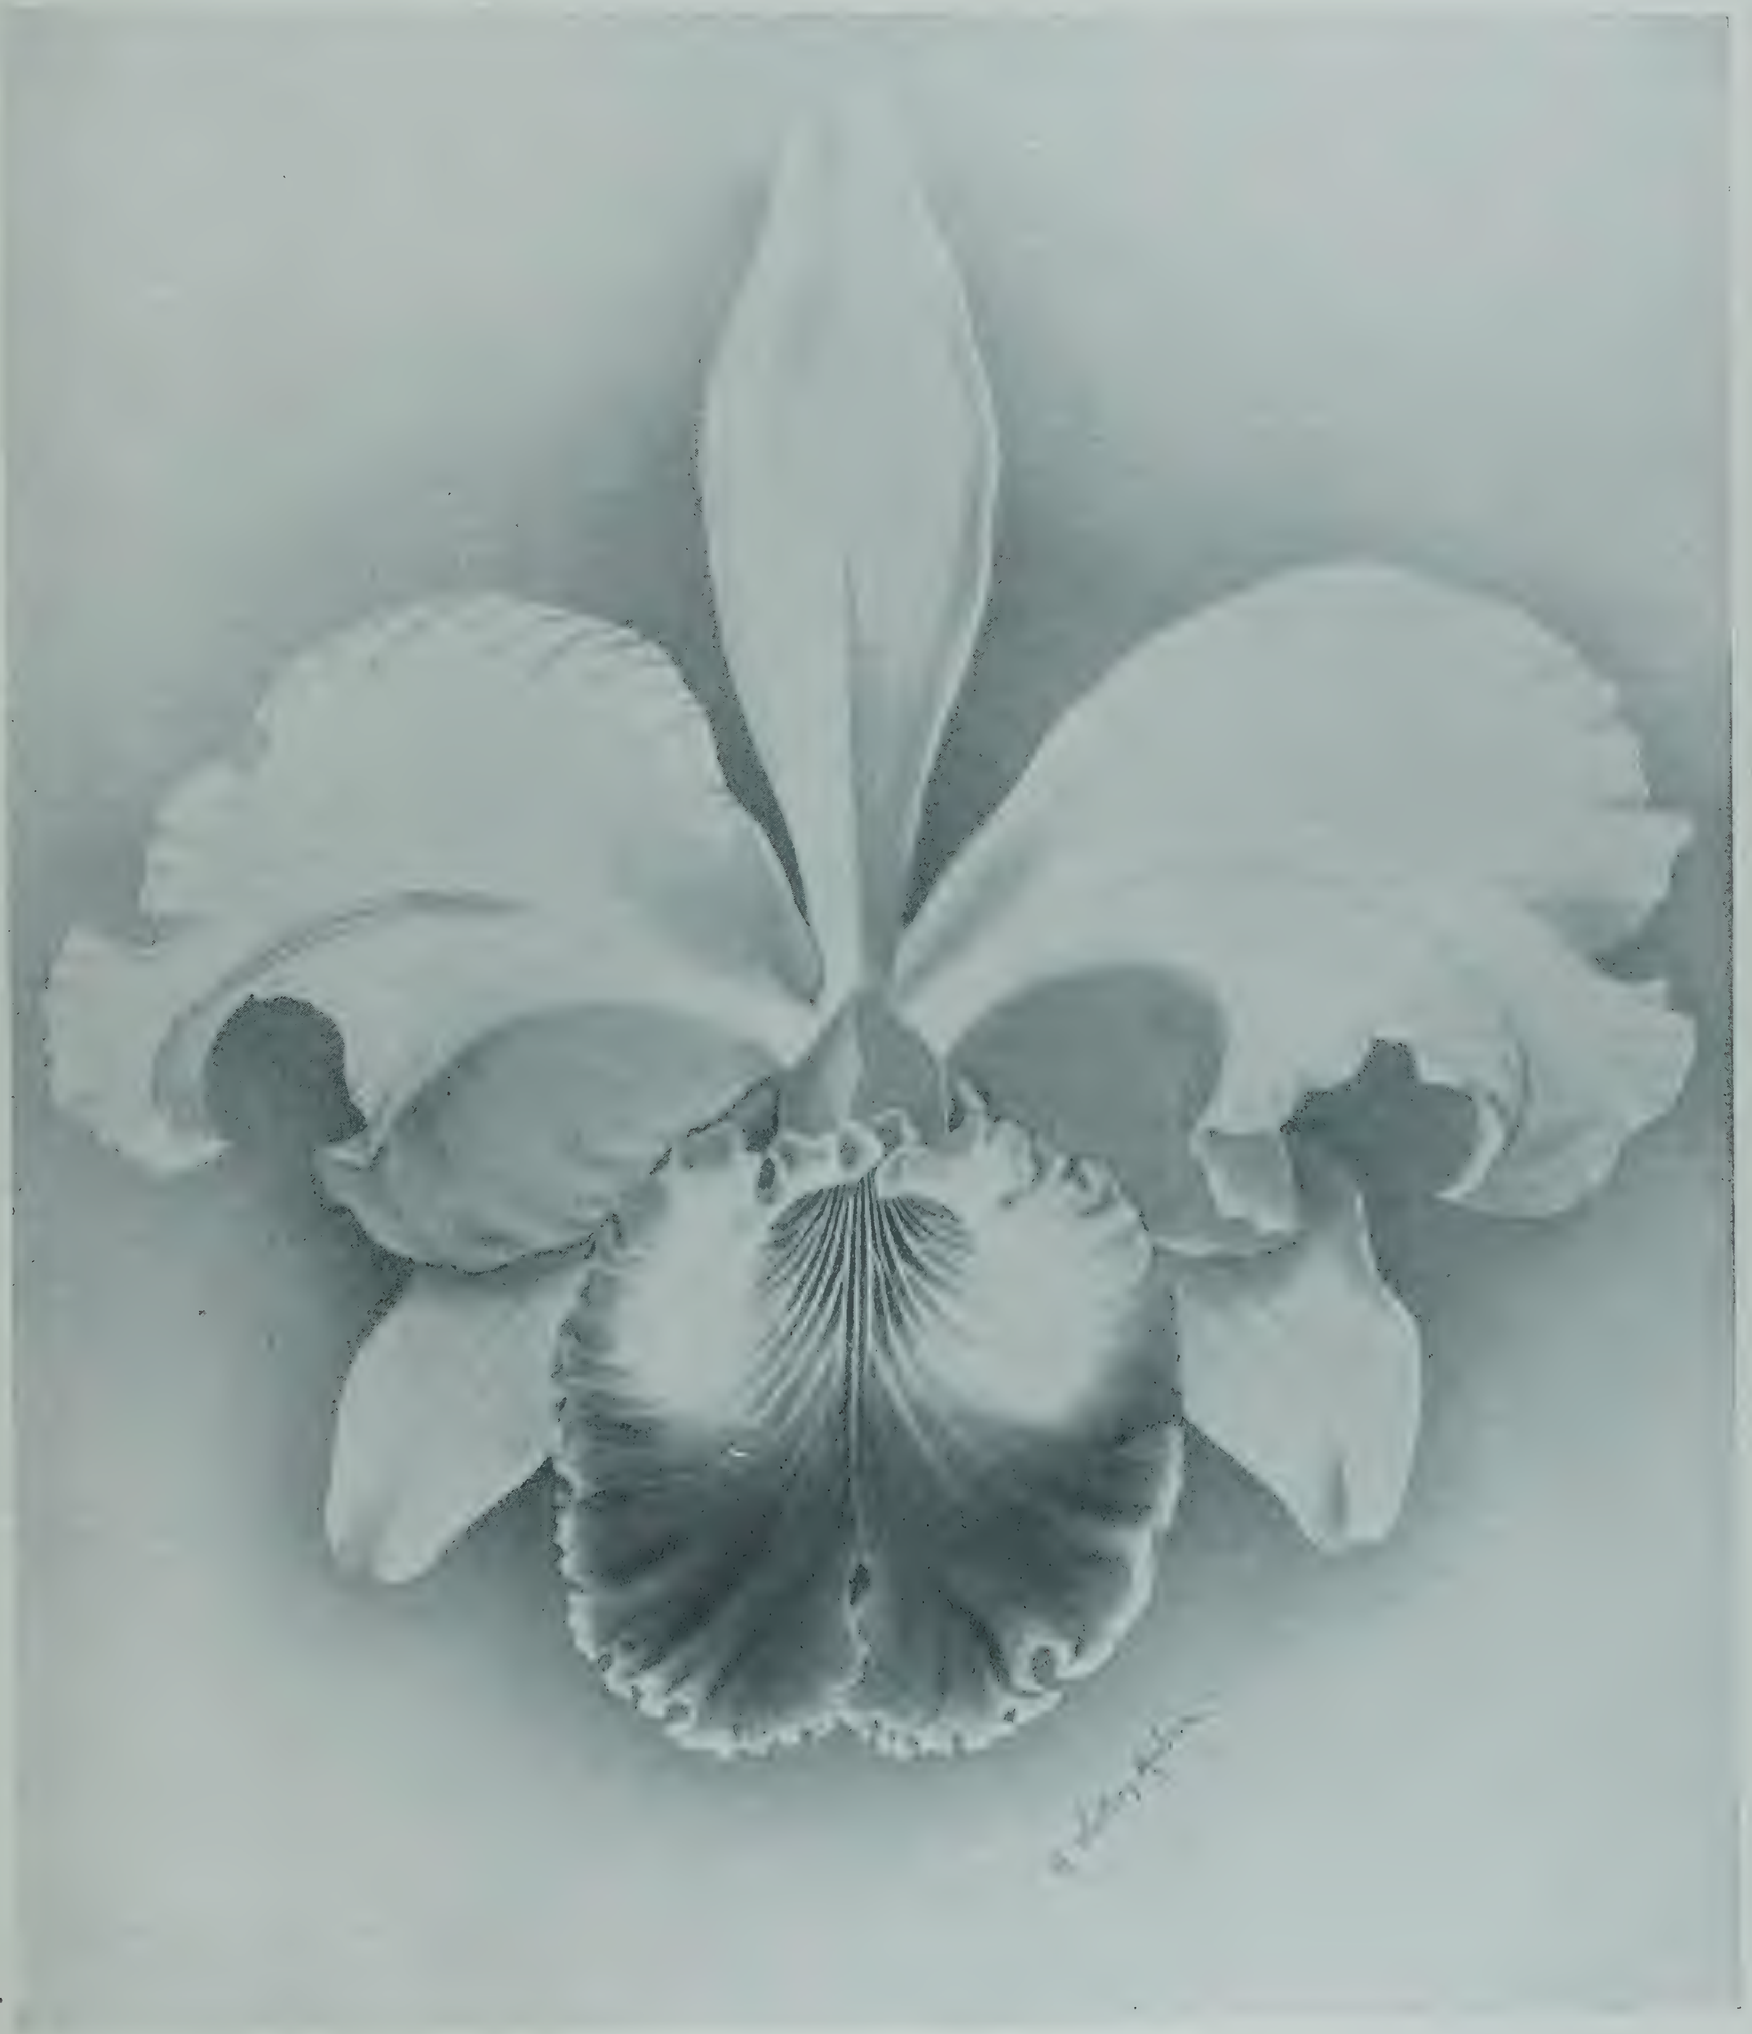

Fig. 193.—Cattleya Dupreana, "The Dell" variety: colour of sepals and petals deep rose; lip marked with crimson.

(For text see p. 442.)

Botany in N. S. Wales. The presidential address delivered to the Royal Society of New South Wales by Mr. J. H. Maiden, Government Botanist and Director of the Botanic Gardens, Sydney, will be read with interest and appreciation by botanists in all parts of the Empire. Among the subjects with which Mr. Maiden deals are Sir Joseph Hooker's contributions to Australian botany, which began as the result of the Antarctic voyage of the "Erebus" and "Terror" in 1839-1842, continued throughout Hooker's official life at Kew, and terminated only with his death. Mr. Maiden's address contains an interesting review of the development of the early scientific societies in New South Wales, of which the Philosophical Society of Australasia, founded in 1821, was the parent. Now, as in this country, the number of scientific societies is legion.

Of great interest also is Mr. Maiden's account of the Northern Territory Expedition of 1911, which was organised by the Commonwealth Government, and charged with the work of exploring the natural resources of the great Northern Territory. Accounts of the recent Antarctic expeditions of Scott, Amundsen, and other explorers are, of course, included in this section of Mr. Maiden's paper.

One of the most noteworthy changes which have occurred in the flora of New South Wales is the escape from cultivation and wide dissemination of the Prickly Pear, and it is natural that Mr. Maiden should devote a considerable part of his address to tracing the history of this instance of acclimatation. Of the many species of Opuntia which grow in Australian gardens the following have escaped, and established themselves in various parts of the Continent:—Opuntia aurantiaca, O. imbricata, O. nigricans, O. inermis, O. ficus-indica, O. tomentosa, O. monacantha, O. Dillenii, O. microdasys, an unnamed species of Opuntia, and Nopalea (Opuntia) dejecta.

The Prickly Pear of New South Wales legislation is Opuntia nigricans, and the pest Pear is a variety of O. inermis. The latter is the serious pest, both in New South Wales and Queensland, and has shown itself so adaptable to Australian conditions as to have become "one of the wonders of the world in plant acclimatation." On the recommendation of Mr. Maiden, a committee has been appointed to investigate means of exterminating this pest, and has secured the services of a botanist to carry out the experimental work necessary for this purpose.

Among other subjects dealt with in the address are the teaching of botany in Australian schools, the new census of New South Wales plants, and the functions of a botanic garden. With respect to the last topic, it is interesting to learn that the Sydney Botanic Garden, now in charge of Mr. Maiden, came into informal existence in 1788, at the time that the first fleet arrived at Sydney from Rio de Janeiro, bringing with it vegetable seeds from England and economic plants from South America. These were planted, and thus was formed the nucleus of the Botanic Garden. The formal establishment of the garden took place some 20

Coloured Plate.—The subject of the coloured plate to be published with the next issue is Momordica Charantia.

The Surveyors' Institution.—The next ordinary general meeting will be held in the Lecture Hall of the Institution on the 16th inst., when a paper will be read by Mr. M. C. Duchesne, entitled "The Value and Marketing of English Timber." The chair will be taken at five o'clock.

Market Gardeners' Compensation Bills Withdrawn.—In the House of Commons on Wednesday last, Mr. Cecil Harmsworth, speaking on behalf of Mr. Runciman, stated that it was the desire of the President of the Board of Agriculture that the Market Gardeners' Compensation Bills, Nos. 1 and 2, should be discharged from the committee. The Government have withdrawn these bills because of their contentious character, there being no prospect of carrying them into law. It is suggested that an agreed Bill should be introduced early in the New Year.

The Aftermath of War.—It is not only the trade in attar of Roses which is suffering from the Balkan war. The Eastern market in Prunes is idle, Figs from Smyrna are few, and, as we learn from Mr. H. Martinet's note in *Le Jardin,* Roumania is suffering from the fact that its harvest of Haricots is laid up at the wharves owing to the blockade. To the watcher of events from afar these may seem but small matters; but the reflective mind recognises that the failure of commerce is not the least tragic aspect of the grim disaster of war.

Biphosphate.—The new artificial phosphatic manure—biphosphate—which is produced as a by-product in the course of manufacture of nitrate of lime, is stated to contain 26 per cent. of phosphoric acid and 23.8 per cent. of nitrate of lime. Samples of this artificial fertiliser are on view at, and small quantities may be obtained by British manufacturers from, the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Tobacco Growing in Ontario.—In the south-western peninsula of Ontario tobacco growing has become a very profitable branch of farming. In order to place the industry on a substantial footing, the Dominion Department of Agriculture some three years ago established an experimental station at Harrow, in the county of Essex. The station, which comprises 38½ acres, is carried on to some extent as an ordinary farm. Last year 15 acres were devoted to tobacco experiments, in which nine of improved Burley and six of Warne varieties were dealt with. Tests were made with different kinds of beds, methods of curing, various combinations of fertilisers, seed selection, combating the tobacco worm, &c. It has been found that white Burley is the better for the average farmer to grow. During the past three years the average price secured for this tobacco has been 1s. per lb., or an average gross return of £50 sterling per acre.

The Reims Congress.—The congress on electricity in relation to horticulture which was held recently at Reims, demonstrated the remarkable variety of the ways in which electricity serves the ends of horticulture. At the last session of the congress it was decided to establish prizes for researches in electro-culture, and to found an International Association to be devoted to the interests of this subject. A second

New Hybrid Freesias.—According to the Italian journal *La Campagna* a number of remarkably beautiful hybrid Freesias have been raised by M. Carlo Lorenz, a horticulturist of Palermo. The *Revue de l'Horticulture Belge* (Nov. 1, 1912), in giving an account of the new forms, states, on the authority of the Italian journal, that the hybrids in question are generic and that they have been produced by crossing Freesia refracta with Sparaxis tricolor. It is stated further that the cross which was made first in 1905, with the Freesia as seed parent, yielded three plants, of which two resembled Freesia refracta and the third possessed flowers of a deeper violet and with clearer stripes. From this plant all the hybrids have been obtained. In the varied structure of the corolla and its expanded form and consistence, as well as in the amount of branching and in the narrow, stiff leaves the hybrids resemble Sparaxis tricolor. It is to be regretted that the two Freesia-like plants were discarded, and it is to be hoped that more information will be forthcoming on the subject of these productions.

Frilled Cyclamen.—On several occasions (see *Gardeners' Chronicle,* March 5, 1898, p. 135, fig. 55) we have illustrated varieties of Cyclamen in which the flowers are modified in various directions, some of them having segments with beautifully-frilled margins. Flowers of this latter type have been sent recently by Mr. Jas. Hawkes, gardener to the Earl of Jersey, at Osterley Park, and they represent a very good strain. Some of the flowers were 3½ inches in diameter, of brilliant colours, and exhibited extraordinary fimbriation. Our correspondent states that he has tried to develop this strain for some years by crossing and seed selection, and he is satisfied that the flowers have such substance that they are capable of lasting an unusually long time in good condition

A Reserve of Wild Nature.—Under the above title the *Times* announced recently the gift—to the National Trust for places of historic interest or natural beauty—of Blakeney Point, Norfolk. The land thus vested in the National Trust lies on the north coast of Norfolk, and is about 1,000 acres in extent. The facts that Blakeney Point possesses an interesting maritime flora and is remarkable for the variety of its birds, make the gift, which is due to the generosity of the Fishmongers Company and of certain private individuals, a particularly valuable one.

Chrysanthemum Diseases.—In a report on the treatment of diseases of the Chrysanthemum, presented to the recent congress of Chrysanthemistes and summarised in *Le Jardin* (No. 619, December 5), Mr. Crepin recommends the following species: *Leaf-scorch* (Septoria Chrysanthemi): Treat by pulverisation on the upper and lower sides of the leaves of a mixture containing potassium penta-sulphide, permanganate of potash and water in the proportions of 1 ounce, ⅙ ounce and 2 gallons of the respective ingredients. This treatment should be followed by vigorous dredging with flowers of sulphur or nicotined sulphur. It serves also as a preventive against rust. *Rust*: When an outbreak of rust has occurred, Mr. Crepin recommends the use of the mixture described, with the addition thereto of ⅙ ounce of formalin (formaldehyde). The plant may be dipped and stirred in the mixture, and whilst the plant is still wet sulphur should be dredged upon it. Plants which have been brought into glasshouses or under shelter, if affected with any fungous disease, should be treated with a solution of per-

SCOTLAND.

FIRE IN A GLASGOW FRUIT WAKEHOUSE.

Through an outbreak of fire, which took place late on the night of Sunday, December 1, the large warehouse of Messrs. Simons, Jacob & Co., wholesale fruit merchants, Glasgow, was destroyed. Upwards of 200 firemen and 16 motor fire-engines were engaged, but all they could do was to prevent the fire from extending to adjoining properties.

The fire also destroyed the Central Commercial Salerooms, used by several firms for fruit sales. The premises of Messrs. Thomas Allen and Co., fruit merchants, in the lane between Candelriggs and Brunswick Street, were also damaged by fire and water. The damage is estimated at about £60,000.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Phalænopsis intermedia Portei (see fig. 194).—It may interest your readers to know that after five years resting the large plant of Phalænopsis intermedia Portei, which has been at Tring for over 30 years, has again flowered. It produced this year three large-branched spikes, with a total of 185 flowers and fully-developed buds. The largest spike has 13 branches with 84 flowers and buds, the next largest 7 branches with 61 flowers and buds, and the smallest 5 branches with 40 flowers and buds. The plant was among an importation of Phalænopsis Aphrodite sent home by Boxall to Messrs. Hugh Low & Co. some 32 years ago. *Walter Rothschild, Tring Park, December 9.*

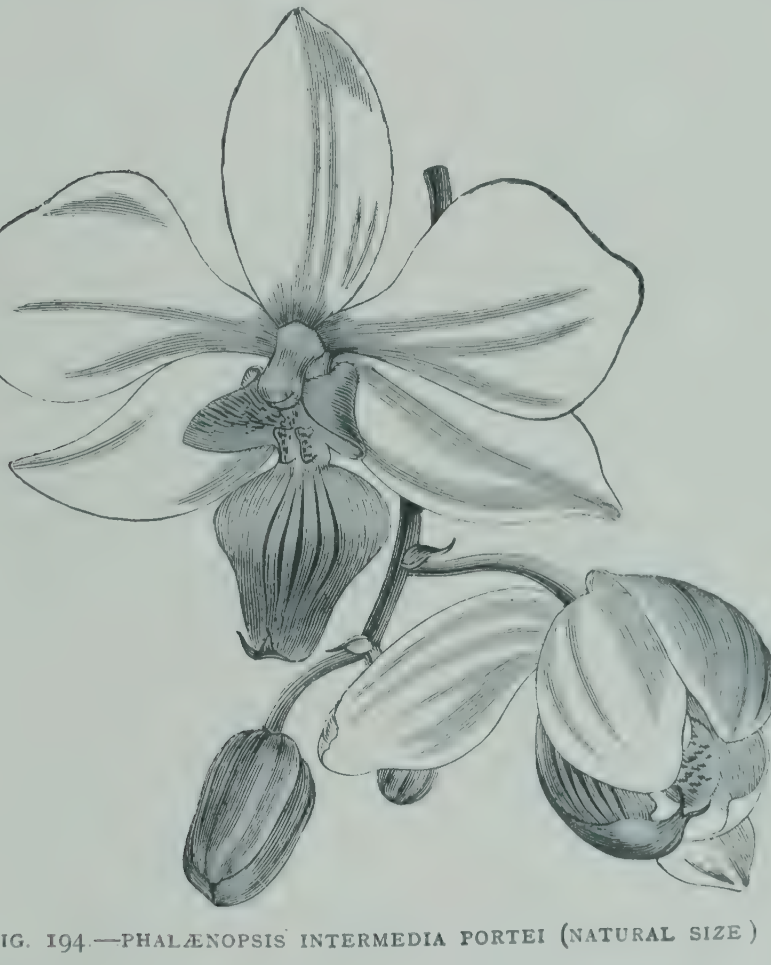

FIG. 194.—PHALÆNOPSIS INTERMEDIA PORTEI (NATURAL SIZE)

The R.H.S. Trials and Names. — Messrs. Kelway & Son raise a most important question in the last number of the *Gardeners' Chronicle*. I do not agree with all Messrs. Kelway say. I might ask why did not they themselves send a full collection of Delphiniums? Have they so many orders for them at a guinea a time that they could not spare them? The point of their letter is that in R.H.S. Records the name of the raiser should follow the variety obtaining an Award whenever possible, and I agree in this, and so I think will all fair-minded people. May I suggest to the R.H.S. that they take a leaf out of the book of the National Sweet Pea Society and record trials thus:—"Sweet Pea Countess Spencer (Cole-Sydenham, 1904)." Cole is the raiser and Sydenham the introducer in 1904. The R.H.S. could improve on this. It could give the raiser and, in their case, the sender's name in different type. It would run thus:—"Sweet Pea Countess Spencer (Cole—*Sydenham*), F.C.C., 1901." The information in some cases would be difficult to obtain, but if, when inviting trials, it was requested that the raiser's name in every known case be added after the name of the variety, many would be obtained and gradually a mass of valuable historical information would be accumulated. *W. Cuthbertson (of Dobbie & Co., Edinburgh).*

Hot-water Method of Forcing. — On October 25 last I lifted a fine plant of the common Lilac, also six specimens each of the varieties Charles X and Mme. Legraye and planted them in tubs. They were placed in a temperature averaging 65° and subjected twice daily to a heavy syringing of water warmed to 120°; the roots were also soaked once weekly with water at the same temperature. On November 26 I cut spikes of the common Lilac, there being over 300 inflorescences on the plant. The flowers of the other varieties were a little later. Although the blooms of the common variety are not large, they are very useful, and possess a delightful fragrance. I adopted the plan through reading the article in *Gardeners' Chronicle* on the use of hot water for forcing, in the issue for December 4, 1909, p. 378. *S. Gilthorpe, Nynehead Court Gardens, Wellington, Somerset.*

Hybrid Nomenclature (p. 431.)—There is little in Mr. Rolfe's remarks on this subject which might be referred to as matter of general interest. The Latinised names which he cites as being given by me were perfectly in order, as they applied to primary hybrids, and were not given to supersede previously-recorded names. But there is one remark which might be discussed with advantage, namely, his quotation from the Vienna rules: "Ternary hybrids, or those of a higher (more complex) order, are designated like ordinary hybrids." That implies that the more mixed the parentage the higher the order in their standing as hybrids." My opinion is that garden-raised plants of complex parentage are not hybrids at all in the true sense, and the term is only applied to them for convenience. The following extract from the "Rules of Nomenclature" at Brussels, 1910, clearly indicates the nature of the hybrid of a higher order:—"Ternary hybrids or those of a higher order (crosses between *species* of the same genus) are designated by a name or a formula." That is a very different thing, and it goes quite far enough. Indeed, I cannot see for what reason ternary hybrids were brought into the question. It is well known to those who are on the practical side of Orchid raising that the more complex the parentage, the more unreliable the progeny in any recognisable character, and so far from being of a "higher order," while there may be an occasional fine form, the bulk of a cherished batch sometimes gets put on the fire. Some discussion on this variability would be very interesting; I have notes on the subject which one would scarcely believe were they not well authenticated. *James O'Brien.*

———Formerly the practice was that botanists gave names to genera and species and gardeners gave names to varieties and "sorts." When hybrids were raised artificially, the gardeners gave them names also. Botanists looked on unconcernedly. A hybrid Rose, Rhododendron, Erica, Pelargonium, Calceolaria or Hippeastrum was to them of no more importance than a new Apple or Cabbage. They did not object to the use of Latin names such as bicolor, Broughtonii and hybrida. When they altered the names of Kentias, Latanias, Seaforthias and Geraniums, gardeners paid no heed. Orchids came into horticulture very gradually, and when they were new a botanist, generally Dr. Lindley, named them. He was succeeded by the autocrat, Reichenbach, who had a keen eye for differences, which led him to make too many genera and to see species where he should have seen varieties. This pleased the growers and dealers, of course. When the breeders got to work on Orchids, they obtained results which proved that a considerable number of these genera were so nearly related as to interbreed, a proof of blood relationship too close to admit of their standing as separate genera. The trouble began when botanists failed to recognise this. They preferred to look upon such hybrids as bigeneric, and gave them names to indicate this, such as Brasso-Cattleya, Epi-Cattleya, Sophro-Cattleya. The practical commonsense plan would have been to give the hybrid the same generic name as the parent it most resembled, seeing that names need not be pedigrees nor yet histories. Now we have such absurd names as Brasso-Cattleya-Lælia, Sophro-Cattleya-Lælia, and we may soon have Epi-Sophro-Brasso-Cattleya-Lælia! The same kind of nonsense occurs in the specific names of hybrids, as, for example, Cypripedium Leeano-Chamberlainianum, Lælio-Cattleya crispo-Schilleriana, and Brasso-Cattleya Digbyano-Mossiæ. Many years ago, a Daffodil conference was held for the purpose of setting the names of the plants in order. It was then decided to name all the hybrid and seedling Daffodils in the florist's, not the botanist's way. The late Professor Michael Foster, a gardener-botanist, held that such names should be easy to write, read and speak. This should be the one golden rule for all garden plant names. There is the very practical objection to these fearful Orchid names that they are the exact opposite to what the worthy Professor recommended. Gardeners are themselves largely to blame for this, because, instead of naming their home-bred Orchids, as breeders of other kinds of plants do, they asked the botanists to do it for them. I agree with much of what Mr. O'Brien says, and can also sympathise with Mr. Rolfe's defence of the plan adopted in the *Orchid Stud Book*, notwithstanding his effort to make us swallow Paphiopedilum and Phragmopedilum. I am heretic enough to say blow the conferences and confound the botanists who have helped to make Orchid names what so many of them are. Mr. O'Brien says we need a simple plan of naming over which there can be no dispute; I would go further by saying we require something more drastic to make the names of garden Orchids easy to read, write and speak. This is a matter that concerns the gardener and fancier, not the botanist. The leading breeders and growers should therefore confer and put the names in order, "mopping off" the long and ugly ones and substituting better, as was done in the case of Daffodils. Until this is done we shall continue to get more of the same objectionable names. Only last week two new Orchids were shown and certificated with the following names:—Sophro-Lælio-Cattleya Carna and Lælio-Cattleya Golden Oriole var. Ruby. I should have called them Cattleya Carna and Cattleya Ruby. *W. W.*

GRAPE MADRESFIELD COURT.—In Barron's *Vines and Vine Culture* a remarkable error respecting the cracking of the berries of Madresfield Court Grape remains uncorrected, even in the fifth or latest edition. How such an error has hitherto escaped the notice of the various reviewers of this standard book and has been allowed to be repeated in each of the subsequent editions remains a mystery. A paragraph in the cultural notes on Madresfield Court vine reads:—"If allowed to hang long, the berries are somewhat liable to crack." Such a statement is entirely inaccurate and misleading, for, as all good cultivators know, it is during the earliest stages of changing colour and whilst the berries are swelling a second time after the stoning process that any cracking of the berries takes place. Once the colouring and swelling are complete, no matter how long the Grapes may hang, no cracking takes place afterwards. The splitting is due entirely to wrong atmospheric conditions of the vineries from the very commencement when the grapes begin to change colour. Every season we are asked by numbers of growers—chiefly amateurs—the cause of their Grapes cracking, and, when informed of the true cause, they are somewhat puzzled. The mistake should be corrected in future editions. *W. Crump, Madresfield Court Gardens, Malvern.*

MR. H. W. ADNITT, RETIRING JOINT SECRETARY OF THE SHROPSHIRE HORTICULTURAL SOCIETY.

A STEP IN THE RIGHT DIRECTION.—All gardeners will note with pleasure that the Board of Agriculture are about to show their recognition of the importance of horticulture by appointing inspectors in this branch of their department. It is to be earnestly hoped that the Board will appoint good, practical men to the vacancies (as advertised in *Gardeners' Chronicle* for December 7), and will not follow the example of the London County Council and give the appointments to military officers. Gardeners and their calling have long been neglected, but it is now to be hoped that their worth and merit will in future be appreciated at their proper value. When one compares the results achieved by gardeners and the many difficulties they have to contend with, surely no one will excuse me of egotism when I claim that gardeners are, as a rule, men of grit and intelligence, whose services should be recognised and rewarded according to their full value, which has not hitherto been the case. *Wilmot H. Yates, Rotherfield Park, Hants.*

POTATO HAULM AS FOOD FOR COWS (see p. 431).—During the dry summer of 1911 I used several acres of Potato haulm as food for milch cows and young stock with good results. The Potatos had made much top growth, and by the second week in September I concluded the leaves had nearly fulfilled their function, and commenced cutting the haulm for the cows, as grass was very scarce. The animals appeared to appreciate their daily allowance, and repaid us for the treat of green food by giving additional milk. *E. Molyneux, Hampshire.*

SCARING BIRDS (see p. 392).—Whether "the gardener's first duty is towards his employer," as *A. C. B.* asserts, is open to question, and must be left to the conscience of each individual gardener to decide for himself. But gardeners, in common with all other men, have duties to their neighbours (i.e., the rest of the community) which are quite as important, but are apt to be forgotten. For instance, if a gardener finds that a certain kind of bird is destructive in his garden, is he justified in endeavouring to exterminate that kind of bird in his district, without regard to the probable fact that it is very useful to a neighbouring gardener, who grows some other kind of crop, which would be destroyed or seriously damaged by insects which form the favourite food of the bird in question? The obvious answer is: "No, certainly not; but he should take steps to keep the bird from his crops without endangering his neighbours'." Well, then, why doesn't he? The answer is again obvious: "To do so without killing off the bird would mean endless bother and expense, and it is much easier to kill the birds." The corollary to this is, of course, "Never mind the selfish and brutal side of the question, so long as *my* purpose is achieved, namely, the saving of my employer's crops." I mean no offence to any correspondent in thus writing, but wish to put before them a view of the case which is usually overlooked. I am glad Miss Gardiner has written, but surely a person need not be a "bird enthusiast" to appreciate the callous brutality of shooting a harmless and beautiful gull—scarcely "in self-defence," *A. C. B*!—to scare a few tits from one's Sweet Peas. I can imagine the hullabaloo *W. A. M.* and A. J. Elgar would kick up if someone were to shoot their pet dogs and cats—probably real nuisances to their neighbours!—to make rugs or doormats of, or to use for scaring cats or birds, respectively, as the case might be, from his garden. Yes, but, of course, we know those dogs and cats are private property and therefore sacred (!), whilst the wild birds—well, to whom do they belong? Certainly not to *A. J. E.* and *W. A. M.* more than to the rest of mankind. *C. Nicholson, Hale End, Chingford.*

THE SHROPSHIRE HORTICULTURAL SOCIETY.

RETIREMENT OF THE JOINT SECRETARIES.

OUR readers will hear with regret that Messrs. H. W. Adnitt and W. W. Naunton, the hon. secretaries of the Shropshire Horticultural Society, who have acted in that capacity from the establishment of the society, 38 years ago, have decided to resign these offices. Those who have followed the fortunes of the Shrewsbury shows, whether as judges, exhibitors, or journalists, know full well that the marvellous success which has been achieved is directly attributable to the business capacity, the horticultural sympathy, and the unvarying courtesy of the two principal officers.

Since the small and unpretentious beginning in the year 1875, the society has pursued its aims with uninterrupted success. During the period referred to, the total income has exceeded £131,000, and from its profits the committee has voted at various times donations amounting to nearly £14,000 to the Corporation of Shrewsbury for improving the show grounds, public buildings, and institutions of the town. But, beyond the financial assistance rendered locally, the general taste for horticulture has been encouraged by the splendid exhibitions held every year. They have attracted the best cultivators of horticultural produce in these islands, and it is not too much to say that the displays of indoor fruits have been unequalled for their superb quality. Messrs. Adnitt and Naunton gained and held the sympathy of exhibitors in a remarkable degree, and were ever looking for some means of adding new features to give fresh interest to their shows. Many years ago the development of the mixed groups of ornamental plants gave Shrewsbury a distinct prominence amongst provincial shows, and, later, the institution of the champion challenge class for Grapes caused the displays to be talked about wherever gardeners happened to meet. The Shropshire Society, too, was amongst the first to encourage high-class exhibits of vegetables, and the strict rules enforced in regard to this and all other sections of the exhibition had the effect of maintaining a very high standard. It is true that the exhibitions were accompanied by various kinds of amusement in the Quarry grounds; but if the society felt bound to have these for raising the funds that were necessary to success, it must be freely acknowledged that the hon. secretaries never failed to hold the horticultural exhibitions in the highest regard, and their efforts were always directed first to furthering the interests of those who visited the Quarry for the purpose of inspecting the show. Messrs. Adnitt and Naunton will carry with them in their retirement the good wishes and grateful recognition of all who know the splendid work they have done for the Shropshire Society and for horticultu

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

December 3.—*Present:* Mr. E. A. Bowles, M.A. (in the Chair); Sir Harry Veitch, Messrs. A. Worsley, G. Wilson, J. O'Brien, J. Fraser, J. T. Bennett-Poë, C. E. Shea, A. W. Sutton, W. Hales, J. Odell, R. Hooper Pearson, and F. J. Chittenden (hon. sec.).

Prunus Miqueliana.—Mr. G. Wilson drew attention to this beautiful shrub which flowers in the open in December in Sussex and elsewhere (see *Gardeners' Chronicle*, December 7, 1912.) Its appearance suggests a garden origin, for the flowers are semi-double.

Fern in bottle.—Mr. J. Fraser showed a specimen of a Fern, Cystopteris fragilis, growing in a bottle, in which it was found in a garden. Though this Fern usually loses its leaves in July, the present specimen was still green.

Orange-fruited Holly.—Mr. E. A. Bowles showed orange-coloured fruits from a Holly in his garden. The tree is probably identical with that referred to in Dallimore's *Holly, Yew and Box* under the name Ilex aquifolium fructu-aurantiaco. It is there suggested that this is a seedling from the yellow-fruited variety, and the tree in Mr. Bowles's garden is apparently of similar origin.

Lælia pumila × Lælio-Cattleya Ophir (Lælia xanthina × Cattleya aurea).—Mr. G. Wilson said this hybrid with cream-white sepals and petals and purple labellum was raised by Mr. R. G. Thwaites, of Streatham Hill, and was shown by him in support of his hypothesis that white flowers are produced by a mixture of red, blue, and yellow.

The committee will not meet on December 17, there being no general show on that day.

HORTICULTURAL CLUB.

December 3.—After the usual monthly dinner of this club, at which Sir Harry Veitch presided and upwards of fifty members and friends (including many ladies) were present, Mr. Arthur W. Sutton, F.L.S., gave a lecture entitled "My Desert Camping Tour to Mount Sinai," illustrated by a hundred splendid photographs taken by him *en route* and beautifully coloured. Mr. Sutton, who takes a particular interest in the evidence afforded in favour of the accuracy of biblical records by the actual localities to which they refer, explained at the outset that he was heavily handicapped in this direction by the shortness of time at his disposal and the difficulty he felt in not dwelling at too great a length on the many interesting points in this particular connection. The lecturer commenced with a map of the region which he had traversed circuitously for some 200 miles in company with Dr. Mackinnon, the well-known medical missionary of the Edinburgh Mission in Damascus. The first visit made was to the traditional spot where the passage of the Red Sea was effected by the Israelites. It would appear, however, that there are three places which claim to be the site of the passage. One, to the north, where the water is very narrow and shallow, is considered by some travellers as the most likely, as an exceptional state of tide and wind might have facilitated the passage, while the other two involve the traversing of deep water and a much greater distance. The views of the desert were excellent, apparently limitless streaks of barren sand without a trace of vegetation, alternating with views of brilliantly green oases of Palms, sometimes, thanks to a local supply of water and the generally warm climate, of such luxuriant growth as to be traversable only with difficulty. The general temperature varied from 100° in the shade during the day to very near the freezing point at night. The pervading conditions of sand and the consequent limitation to camels for transport of both travellers and their impedimenta rendered the whole journey a most difficult one, camel riding being so uncomfortable as to compel frequent descents for a rest and walking being in its turn equally exhausting, so that recourse to the camel's back for variety's sake involved no particular charm, and this, with short intervals of rest on the dry, heated plain and day after day, did but little to recommend the Sinai Desert as a popular resort. In time, however, Mount Hebron and its hills of brilliant red, interspersed with black and other coloured outcrops everywhere devoid of even a blade of grass, indicated the approach to Mount Sinai; at Mount Sinai, of course, the biblical records were brought home to the traveller most vividly by the character of the surroundings of these heights, and impressed the grandeur of the Bible story on the minds of the travellers. At Sinai both travellers and their guide and camel drivers enjoyed a welcome rest at the famous monastery prior to the return journey.

PERPETUAL-FLOWERING CARNATION.

ANNUAL DINNER AND GENERAL MEETING.

December 3.—About 30 members and friends of the above Society assembled at dinner on this date in the Holborn Restaurant, under the chairmanship of Mr. J. S. Brunton.

After the usual loyal toasts had been honoured, Mr. M. Todd, of Edinburgh, proposed "Success to the Perpetual-flowering Carnation Society." Mr. E. Hawes responded.

Mr. S. Mortimer proposed the health of the chairman of committee, Mr. J. S. Brunton, who had done so much for the Society. The toast was received with enthusiasm.

The annual general meeting followed the dinner. The report was read by the Hon. Secretary, Mr. E. F. Hawes, and passed. The Hon. Treasurer, Mr. L. J. Cook, presented the financial statement, which showed a small credit balance. All liabilities, said Mr. Cook, had been cleared off, in addition to the £25 voted to the Royal International Exhibition.

The election of officers followed. Lord Howard de Walden was unanimously re-elected president, and several new vice-presidents, including Sir Harry Veitch, were also elected. Mr. J. S. Brunton was re-appointed chairman, and Mr. W. E. Wallace vice-chairman. Mr. L. J. Cook was appointed hon. treasurer, Mr. Hawes having retired from the post, Mr. T. A. Weston was unanimously elected secretary. Mr. Hawes was appointed show superintendent. The General Committee was also elected, the retiring members again serving.

MR. W. W. NAUNTON, RETIRING JOINT SECRETARY OF THE SHROPSHIRE HORTICULTURAL SOCIETY.

THE CONFERENCE.

December 4.—There was a large attendance of the members at the conference, which was held in the Lecture Room of the Royal Horticultural Hall on the above date. Mr. J. S. Brunton presided, and Mr. J. Gardner, of Batsford Park Gardens, Gloucestershire, read a paper on "The Culture of Perpetual-flowering Carnations." We publish the following extracts:—

The Perpetual-flowering Carnation is fast gaining the position of the premier winter-flowering subject for the production of cut blooms. For the decoration of dwelling-rooms, dinner-tables, and similar purposes, the Carnation is unsurpassed by any other flower, and few other flowers continue in a fresh condition for so long a period. These qualities alone are sufficient to render it popular, without taking into account the fact that it is not a difficult plant to grow.

The same plants may be had in flower for 12 months, and, if they are well managed, they will produce blooms during the whole time. Not only do modern varieties produce superior blossoms, but in many cases the habit of growth and the constituents of the plants are distinctly in advance of the old-time favourites.

A matter that might be taken into consideration is the production of varieties with sweet scent; for, although a bloom may be perfect in shape, and the plants possess every good characteristic, if the flowers are scentless they are destitute of a most delightful charm. Whether they possess smooth-edged petals like May Day, or serrated edges like Baroness de Brienen, is really not an important matter, as there is room for both types, for they each appeal to different tastes.

It is essential to devote a suitable house to

Carnations if their cultivation is to be made a success, for it is impossible to grow them well in an indifferent greenhouse among a collection of miscellaneous plants. A span-roofed house provided with a centre stage, and a stage all round next to the outside, is suitable for growing these plants. The house should face to the south so as to obtain the maximum amount of sunshine during the winter, and be fitted with a 4-inch flow pipe under the outside stages, with the returns conducted under the centre stage to maintain the requisite amount of leaf in winter. The stages should be covered with fine shingle or small cinders. Both the top and bottom ventilators should be made to open outwards to the fullest extent.

The best way to make a start is to procure strong plants in small pots early in March; if treated properly they will make fine, bushy plants and commence to flower in October. In subsequent years, with the exception of purchasing any novelties that are required, it is preferable to raise one's own stock. The best time to commence this work is during the latter part of December, and cuttings may be inserted until March.

At Batsford we obtain good results by inserting cuttings in August, procured from plants growing in the open garden. The growths are generally firm and well matured at that season, and they make better plants than those rooted in the winter. By propagating in August, strong plants in 60's are obtained by October; these should be kept in a cool house during the winter, and, after the turn of the year, potted on.

When taking cuttings, it is essential to obtain them from plants that are vigorous and free from disease, so as to ensure the continuance of a healthy stock. Those from the centre part of the stem are the best; they should be removed when about 3 inches long, and prepared in the usual way. We obtain good results by inserting them singly in small thumb pots filled with a compost of loam, leaf-soil, and silver-sand in equal parts. The pots are plunged in fibre in a propagating frame, with a bottom heat of 60° and an overhead temperature of 55°. The frame is kept fairly close until they are rooted. A little air is admitted in the morning for an hour or two, and, at the same time, the condensed moisture is removed from the glass.

It is desirable to shade the cuttings lightly from bright sunshine, and give a gentle spraying overhead with the syringe if required. In such conditions they root readily in from three weeks to a month, when they should be gradually exposed to more air. Of course, this treatment varies a little according to circumstances. Pot the young plants on into 60's, using more loam and less sand in the compost, but make sure that they are moist at the root before being potted, and grow them on in a temperature of from 50° to 55°.

Some growers prefer to root their cuttings in sand only, and by this means more can be propagated in a given space. When this method is followed, the frame should be covered at the bottom with a layer 3 inches deep of firm, moist sand, and the cuttings rooted in the sand; but taking into account the fact that they have to be potted into very small pots before they can be placed in the 3-inch pots, it is doubtful if there is any advantage. When they are rooted in pots they can be potted on without much disturbance at the roots. When the young plants are 5 or 6 inches high, pinch out the tops to induce them to produce side shoots and form a bushy habit. They may also be stopped again later, but not after the end of June.

(To be concluded.)

CIRENCESTER AND DISTRICT GARDENERS'.

November 14.—The first open show of the above society was held in the Bingham Hall, Cirencester, on this date. The entries totalled 236 in 51 classes. Flowers and vegetables were well represented. Honorary exhibits of collections of flowers and plants were staged by Messrs. John Jefferies & Son, Royal Nurseries, and Messrs. Orpet & Son, Cirencester.

In the Chrysanthemum classes the principal prize-winners were Mrs. W. Cripps, the Hon. C. Biddulph, Capt. Gordon Dugdale, and Capt. H. Gordon.

For a miscellaneous group of plants Capt. H. Gordon was awarded the 1st prize, and Lord Grantley, Chesterton, the 2nd prize; and for table plants Mr. T. Kingscote, M.V.O., and Major Ripley were 1st and 2nd respectively.

The principal prizes in the fruit classes were won by the Hon. C. Biddulph, Mrs. W. Cripps, and Capt. Gordon Dugdale.

In the amateur section the chief prize-winners for flowers were Mrs. F. Hobbs, Mrs. Scotford Harmer, Mr. J. C. Eden, Mrs. H. T. Gardener, and Mrs. J. J. Grove.

NEWCASTLE CHRYSANTHEMUM.

November 20, 21.—The eighth annual exhibition of the Newcastle-on-Tyne and District Chrysanthemum Society was held at the Town Hall, Newcastle, on the above dates. The exhibits generally were very good, but in the open class for 36 blooms the competition was not so keen nor the exhibits quite so good, as on some previous occasions.

In the open class for 12 vases of Japanese Chrysanthemums, comprising not fewer than 12 varieties, three blooms in each vase, the Countess of Ravensworth, Cresswell Hall, Morpeth (gr. Mr. R. Addison), was placed 1st. The varieties Mrs. A. T. Miller, Lady Talbot, Bessie Godfrey, and Miss E. Fulton were especially fine. Dr. J. B. Simpson, Bradley Hall, Wylam (gr. Mr. J. Kerr), was placed 2nd, and Capt. Laycock, D.S.O., of Wiseton, Bawtry (gr. Mr. G. Musk), 3rd. The flowers of F. S. Vallis in this latter exhibit were awarded a Medal as the best blooms in the show.

For six vases of Japanese Chrysanthemums (various), the Countess of Ravensworth was again placed 1st, with a fine exhibit, in which the varieties Elsie Fulton, F. S. Vallis, and Lady Talbot were especially noticeable. The Rt. Hon. Walter Runciman, M.P. (gr. Mr. Askew), was placed 2nd, and Capt. Laycock 3rd.

For four vases of Japanese (various), the 1st prize was gained by C. Lacy-Thompson, Esq., Farlam Hall, Cumberland (gr. Mr. A. W. Appleton), and the 2nd by Capt. Laycock. For one vase of white Japanese, the Countess of Ravensworth was again successful, with "White Queen"; 2nd C. Lacy-Thompson, Esq. For three blooms of a yellow Japanese variety, Capt. Laycock was awarded the 1st prize. In the class for three blooms of Japanese varieties of any colour but yellow, Capt. Laycock was again placed 1st, and the Countess of Ravensworth 2nd. For four vases of Incurved blooms, the Rt. Hon. W. Runciman was awarded the 1st prize.

For two vases of Incurved varieties, the Rt. Hon. W. Runciman was placed 1st, and Capt. Laycock 2nd, whilst for six vases of single Chrysanthemums, Capt. Laycock was awarded the 1st prize and Lord Allendale the 2nd prize.

One section was open only to exhibitors from Northumberland and Durham. In the class for four vases of Japanese blooms, various, Dr. J. B. Simpson was placed 1st. He showed fine blooms of F. S. Vallis, Frances Jolliffe, and the Hon. Mrs. Lopes. The cup offered in this class is now Dr. Simpson's own property, as he has won it three times in succession. For four vases of Japanese blooms, open to exhibitors within a radius of three miles of Newcastle, the 1st prize was awarded to Mrs. Hunter, The Grange, Wickham.

The 15-guinea challenge cup offered for four plants was won by J. Readhead, Esq.; 2nd, Mr. Thompson, of South Shields. For a group of Chrysanthemums with foliage and other flowering plants, Mr. A. G. Bambridge was placed 1st, with a very artistically-arranged exhibit. 2nd, C. I. Kindell, Esq., Preston House, North Shields (gr. Mr. Hetherington).

A cup of the value of 10 guineas, and a money prize of £2 were offered for a table 6 feet by 4 feet, decorated with flowers. The 1st prize was won by Mr. Lovett (gr. to A. Collingwood, Esq., Lilburn Towers).

Fruit.—For two bunches of white Grapes, the 1st prize was won by the Earl of Durham, Lambton Castle (gr. Mr. W. Smith), and for two bunches of black Grapes C. I. Kindell, Esq., was placed 1st. For six dishes of cooking Apples, the Rt. Hon. Sir Edward Grey, Bart., Fallodon Hall (gr. Mr. J. Henderson), was awarded the 1st prize, and Dr. Stewart, Hexham (gr. Mr. Lloyd), the 2nd prize.

The North of England Horticultural Society awarded several Gold and Silver Medals. A Gold Medal was awarded to Lord Ridley for a miscellaneous group of flowers; another to Messrs. Finney, of Newcastle, for floral designs. Messrs. Sutton & Sons, Reading, were also awarded a Gold Medal for a collection of 75 varieties of Potatos; Mr. Lawrenson, of Newcastle, received a similar award for miscellaneous flowering and foliage plants. Silver Medals were awarded to Mr. W. A. Armstrong, Messrs. Mitchin & Co., Messrs. Dicksons, of Chester, and Messrs. W. J. Watson, Ltd., of Newcastle.

EDINBURGH SEED TRADE ASSISTANTS' ASSOCIATION.

December 6.—The 18th annual dinner of the Edinburgh Seed Trade Assistants was held in the Royal British Hotel, Princes Street, on this date. The company numbered 110. Mr. James Welsh (of Messrs. Dicksons and Co.) presided. Several employers were present.

Mr. David King, in proposing the toast of the evening, "The Seed Trade Assistants," said that Edinburgh assistants in the past had made a reputation for themselves and for Scottish trade in all parts of the world. Mr. James Lyon replied.

Mr. J. W. Forbes (Advocate) proposed the toast of "The Seed and Nursery Trade." Edinburgh, he said, was one of the great centres of the trade. On looking back some hundred years there were then only three or four firms of importance in the Edinburgh trade, and they are still in existence, but the number of firms had increased five or six times, which showed that Edinburgh was still upholding its great reputation. He referred also to several prominent seedsmen who had become distinguished citizens of Edinburgh. He coupled the toast with the name of Mr. A. Chalmers (of Messrs. Stewart and Co.), who, in replying, said that in the last few years trade had become very difficult. There used to be a time when they could calculate the seed crops with a fair amount of accuracy, but now it was impossible to make up a seed catalogue until a very short time before the seeds came in, as the seed market was so much larger that a shortage in one country made prices fluctuate greatly in all others.

SMITHFIELD CLUB.

December 9-13.—Whilst the chief interest in the Smithfield Show at the Royal Agricultural Hall, Islington, centred in the fat beasts, and especially in those exhibited from the Royal farms, there was much of horticultural interest. As usual, Messrs. Carter & Co., Raynes Park, displayed in a fascinating manner excellent examples of various root and stem vegetables grown from their seeds. Of the several kinds of Onions shown, we were especially interested in the variety Silver Ball, a round, flattish bulb, of good size, mild flavour, and with a skin as silvery as that of the well-known pickling variety. Onion "Carter's Record" should be a splendid exhibition variety; the bulbs were very large, solid, and heavy, and of handsome appearance. The Carrots, Summer Favourite and Red Elephant, were of immense size and vivid colour, but not at all gross. Not the least interesting portion of Messrs. Carter's exhibit was a Wardian case containing large numbers of seeds in various stages of germination.

One of the most valuable and instructive features in the stand of Messrs. Sutton & Sons, Reading, was the glass cases containing specimens of injurious insects and their ravages. Besides the "Flea" beetles, Carrot-root fly, and wireworms, of natural size, and also greatly enlarged, there were examples of the dreaded black scab or wart Potato disease. Of other exhibits by Messrs. Sutton, the Cyclamen in 48-sized pots bore very large but dainty flowers. Tomatos were firm and brightly coloured: the varieties were Winter Beauty, Princess of Wales, and Sutton's Abundance. Of the various Onions, the colour of the variety Crimson Globe attracted attention. Such garden Carrots as Sutton's Intermediate, although of much more than average size, seemed very ordinary beside the immense roots of the varieties grown for farm use.

Messrs. John K. King, Coggeshall, showed such varieties of Potato as Lord of the Isles, The Dean (a very dark purple), and King Edward VII. The Tomatos Lord Roberts and Day Dawn might well have been grown in

August. Onions and Carrots were also shown in excellent quality.

Messrs. Toogood & Sons, Southampton, included examples of lawn grass with the admirable Gourds, Vegetable Marrows, Tomatos, and Carrots.

Messrs. Fred. Smith & Co., Woodbridge, brought their gold medal exhibit of vegetables from Norwich, and added many bags of garden Pea seeds, and, in Ladysmith, a desirable late kidney Potato. The russet-skinned tubers are of very good shape and are shallow-eyed.

Messrs. E. Webb & Sons, Wordsley, Stourbridge, staged many varieties of Potato, including the varieties New Guardian, Stourbridge Glory, and Empire. The "Champion Prizetaker" Leeks were exceptionally long and very white. Besides immense Ailsa Craig Onions, the white Autumn Mammoth Cauliflowers were splendid.

Mr. Alex. Blatchford, Coventry, showed many excellent samples of Peas (Excelsior, Sherwood, and Fillbasket), Dwarf Beans (Early Prolific), and roots of Beet, Carrots, and other vegetables.

Messrs. Harrison & Sons, Leicester, also exhibited praiseworthy examples of high-quality Leeks, Carrots, Potatos, and Onions.

The various exhibits of Apples and Pears, chiefly of varieties which bear high colour, served to brighten the stands to an acceptable degree. The King's Acre Nursery Co., Hereford, showed such varieties of Apple as Gloria Mundi, Potts's Seedling, Scarlet Costara, and Devon Red, as well as young, vigorous trees ready for planting. Messrs. W. & J. Brown, Peterborough, arranged some very fine fruits and sturdy, well-trained trees, also the new Potato "Vitality," which was said to have been in full leaf as late as September 10. Messrs. W. Horne & Sons, Cliffe, Rochester, also showed trees and fruits of Apples and Pears. The fruits of Apples Lord Derby, Charles Ross, and Annie Elizabeth were excellent. Messrs. W. Seabrook & Sons, Chelmsford, displayed many standard varieties of Apples. Messrs. Dicksons, Ltd., Chester, contributed fruit trees, forest trees, and the flowers of grasses suitable for permanent pastures.

There were more exhibitors solely of Potatos than usual. Messrs. Fidler & Sons, Reading, had a very large assortment, which included almost every variety worth growing. The tubers of Dreadnought, Invincible, and King George V were clean and good, as also were those of the dark-skinned varieties Herd Laddie, Edgecote, and the pink Leda. Mr. A. Findlay, Auchtermuchty, Scotland, made a speciality of his "New Late Kidney." Potatos were also shown by Mr. R. W. Green, Wisbech; Messrs. J. Poad & Sons, Lundin Links, Fife; and Mr. G. R. Sharp, Blackford, Perth. Messrs. E. W. King, Coggeshall, included Carrots and Onions with their Potatos. Mr. T. A. Scarlett, Edinburgh, exhibited bushes and bottled fruits of a new Black Currant "Edina," and "Champion" Brussels Sprouts, as well as many Potato tubers. Messrs. W. Davie & Co., Haddington, Scotland, and Messrs. Little, Ballantyne & Co., Carlisle, also showed Potatos. The latter firm also had especially good fruit and forest trees. Mr. E. H. Taylor, Welwyn, Herts., exhibited an Apple-storing cabinet, bee appliances, and bouquet wire. The British Basket Co., Crownpoint Works, Glasgow, showed many forms of chip baskets. Messrs. Cardon & Gresno, Chancery Lane, London, set up various samples of Chestnut-wood and wire fencing. Mr. John Unite, Edgware Road, London, had quite a shop, showing canvas for tents, plant-protecting and various tying materials. The Four Oaks Company, Sutton Coldfield, demonstrated the value of their pneumatic sprayers and syringes; and Messrs. Marshall & Phelp, Aberdeen, illustrated the handiness of the "Fountain" spraying and lime-washing machine. Mr. A. E. Hawker, Mark Lane, London, had on view edible Peas and other seeds treated with Corvusine, which not only protects them from birds and mice, but also assists germination.

Chemical and other manures were shown by "Fisons'," Ipswich, and Messrs. Knights &

CONFERENCE ON ORCHIDS.

THE PHYSIOLOGY OF FERTILISATION.*

It has been known for many years that in the majority of plants pollination is essential to seed-formation. The fact is so well established and familiar that pollination, which in strictness denotes the transference of pollen from the stamens to the stigma of a flower, is used sometimes as the equivalent of the term fertilisation.

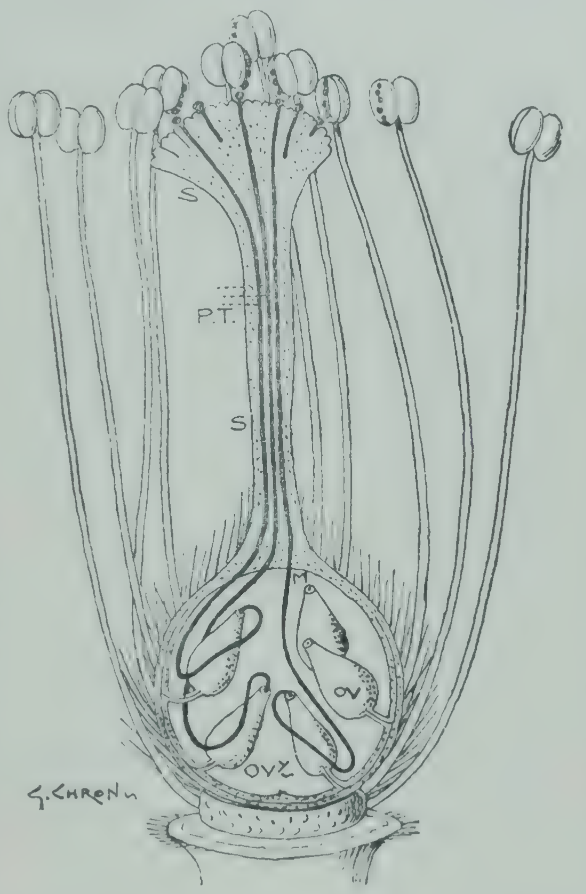

Fig. 197.—Diagrammatic section of flower of Helianthemum marifolium showing pollen tubes.

(P.T.) growing through the style (S), passing into the ovary (OVy) and each reaching the opening (micropyle M) of an ovule (OV), modified (After Kerner & Oliver).

Nevertheless, as we shall see, pollination is but one of a series of somewhat complicated processes which result ultimately in seed formation. Although the dependence of seed-production on pollination has long been known, the nature of the process which intervenes between these events baffled the curiosity and ingenuity of man until comparatively recent times. Of late years our knowledge of these intervening processes has increased very greatly, and since that knowledge is both interesting in itself and useful in its practical bearings, I propose to sketch in rapid outline the figure of our understanding of the process of fertilisation.

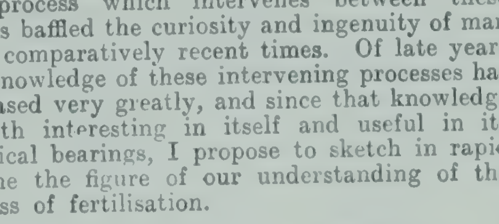

Fig. 198.—Phalænopsis amabilis.

(A column) stigma unpollinated; (B column) 6 days after pollination of stigma; (C column) 6 days after "pollination" with dead pollen; (D) section of column after "pollinating" with cotton wool soaked with pollen extract (After Fitting).

The foundations of our knowledge of the nature of fertilisation were laid a little over three-quarters of a century ago by Amici, who, in 1830, discovered that pollen grains deposited on the stigma send out tubes which pass down the style, enter the ovary and make their way unerringly to the open ends of the ovules (fig. 197). It was not till many years after Amici's time that the real act of fertilisation was observed. Some 40 years ago it was discovered that the pollen tube, after passing through the opening in the coats of an ovule, becomes thin and soft and discharges part of its contents into the ovule.

At the upper end of the ovule lies a minute but definite mass of living substance or protoplasm, which we may describe as the representative of the seed-parent or as the egg-cell. To this egg-cell a similar living mass derived from the pollen tube makes its way, and so representative cells, one of the seed parent and one of the pollen parent, lie close beside one another. Each consists of a denser central body called the nucleus and a more watery envelope of cytoplasm. The two representative cells fuse with one another—nucleus with nucleus and cytoplasm with cytoplasm—and so form a single cell with a single nucleus. This cell, which because of its twofold origin is called the zygote, undergoes growth and division and gives rise to the embryo or plantlet of the seed. The adult plant is derived exclusively from the zygote, which in turn is formed by the union of the two representative cells.

The essentials of this process of fusion are to be observed not in flowering plants only, but also in all but the most rudimentary of the lower plants. These essentials are to be discovered also in animals. Hence we may define fertilisation as the fusion of two representative sexual cells or gametes, and the production therefrom of a single cell, the zygote, which is an incipient individual.

Since the female gamete or egg cell of an ovule does not as a rule form an embryo unless it encounters and fuses with a male gamete, it is evident that this fusion is the essential part of fertilisation and that pollination and the growth of the pollen tubes are but the necessary means to that end. One of the most striking facts which emerge from these discoveries is that both parents make material contributions to the substance of the offspring.

The nuclear contributions appear to be equal in amount and generally similar in kind, but the contributions of cytoplasm made by the two gametes or sexual cells appear to be unequal: the cytoplasm of the egg-cell being considerable, that of the male gamete being smaller in amount and in some cases nil. In the similarity between the nuclei we have the explanation of the well-known fact that, of the many characters exhibited by the offspring, some are derived from one parent, others from the other parent, and others again are intermediate between the paternal and maternal characters. We are not yet, however, in a position to assert that *all* the characters of the offspring are contributed in equal measure by the two parents.

On this subject, however, despite its interest and importance, we cannot dwell now; for we must continue our sketch of the phenomena of fertilisation. Inasmuch as the normal egg-cell does not develop unless it has united with the male gamete, it follows that the latter not only contributes living material toward the upbuilding of the future plant, but that the male cell also provokes or stimulates the egg-cell to grow into the embryo. It might be supposed, and indeed it was supposed until recently, that the growth of the fertilised egg-cell is the direct consequence of the yoking together of the male and female gametes. Just as one horse alone might not be able to draw a cart which two horses may pull easily, so it might be imagined that the female or egg-cell alone is unable to carry on the work of development, which work is easy to the combined forces of the male and female gametes. Recent experiments have shown that this supposition is not correct, and that the development of the egg-cell to form the embryo is due to a definite shock or stimulus which it receives from the male gamete. In terms of our simile, under the powerful stimulus of the whip the single horse may make a supreme effort and set the cart in motion. We are therefore obliged to recognise that fertilisation has a two-fold significance. On the one hand it allows of the formation of an individual which derives materially from the father and the mother and hence may exhibit paternal and maternal characters; on the other hand the male gamete in entering into the egg-cell exerts a stimulus which starts the latter on a course of growth and division resulting in the formation of the embryo.

The evidence in support of the latter conclusion is clear. Thus it has been shown in certain animals and plants that the fertilisation stimulus may be imparted to the egg cell artificially and without the aid of the male gamete.

---

* Lecture by Frederick Keeble, Sc.D., Professor of Botany,

For example, Loeb has demonstrated that, if the egg cells of sea-urchins be taken from the parent and placed in sea water free altogether from male cells, an alteration either of the composition or concentration of the sea water suffices to cause the egg cells to develop into embryos. Nature herself provides us with illustrations of a similar phenomenon in the case of parthenogenetic plants. Species of Hieracium, Alchemilla, Taraxacum, and other plants are known to give rise to good seed even though the egg cells be not fertilised. Similar examples of the parthenogenetic development of eggs into embryos are known among various kinds of animals, and particularly in insects—for instance, in the summer broods of aphides.

In parthenogenetic plants and animals the egg cells carry, as it were, their own stimulus to development; or rather the egg cells of such plants differ from those of the majority of organisms in that they retain the power of development, and are not compelled to await the advent of the male gamete in order to resume their growth. Even more remarkable than the chemical embryos just described are the mechanical embryos which have been produced recently by Bataillon. This experimenter removed the ripe, unfertilised eggs from the frog, punctured each egg by means of a fine glass needle and covered the eggs with water. Of the punctured eggs many died, but out of 1000 which were operated upon no fewer than 120 hatched into tadpoles and actually reached the stage at which the legs are developed and the tail is disappearing.

Astonishing and well-nigh incredible as are these facts they are attested so well that they must be accepted. They are, moreover, susceptible of interpretation in terms of the hypothesis at which we have arrived already. The needle-puncture sets up a disturbance in the egg cell, the effect of which is similar to that exerted by the entrance of the male gamete into the egg cell. In either case, growth and division occur, and the embryo is produced. Needless to say, a tadpole begotten in this manner constitutes a novel and absolute kind of orphan, namely, one that never had a father. It can possess maternal characters only.

Finally, it may be mentioned that Delage and others have succeeded in raising larval animals (Echinoderms) by fertilising egg cells deprived of their nucleus by normal male cells. Such larvæ have nuclear material of paternal origin only, and on current hypothesis they should exhibit paternal characters only.

We are now in a position to state with clearness the significance of fertilisation. By the fusion of the nucleus of the male and female gametes parental characters are transmitted to the offspring; by the entry of the male cell into the egg cell the latter is provoked or stimulated to form the embryo. The stimulation is of a chemical or mechanical nature, and may be brought about by artificial means.

That these conclusions apply also to plants there can be no doubt, and it is by no means improbable that the experimenter of to-morrow may be able to induce plants to develop seed by chemical or mechanical stimulation similar to that which, as we have seen, has proved effective in the lower animals.

It is possible, however, that this experiment has been performed already by Nature herself in the case of Zygopetalum Mackayi.

So far as I know, this Orchid does not produce seed unless it is pollinated. When it is pollinated with the pollen of certain other species, i.e., Odontoglossum crispum, it produces good seed, but to use the words of my friend Mr. O'Brien, the extent of whose knowledge of Orchids is rivalled only by the generosity with which he imparts it, "the progeny still remain Zygopetalum Mackayi, with only sufficient suggestion of a difference in the flowers to prove that the cross has been made. This cross has been made several times with the same result, and other combinations have given rise also to the same progeny." As a contribution to the explanation of this remarkable behaviour, I would offer the following suggestions:—First, that the offspring of the cross Zygopetalum Mackayi by Odontoglossum crispum are pure Zygopetalum Mackayi; second, that the effect of the pollen of the Odontoglossum is that of Bataillon's needle; the pollen or pollen tubes, although they make no material contribution to the egg cell, give the fertilisation-stimulus without which the egg cells of Zygopetalum are unable to develop. Given this stimulus the egg cells develop parthenogenetically. I am willing to admit, however, that the behaviour of this remarkable plant may be yet more subtle than this, but into a discussion of these subtleties this is not the place to enter. The suggestion just offered, that the only part or lot that Odontoglossum crispum has in the fertilisation of Zygopetalum Mackayi is in providing a fertilisation-stimulus, may appear far-fetched to any but those acquainted practically with the ways of Orchids.

Those who work with more torpid, less highly-strung plants may be disposed to ask what justification is there for the suggestion that the pollen of Odontoglossum crispum deposited in the stigmatic surface of Zygopetalum Mackayi may, whilst failing to effect fertilisation, yet act as a stimulus to the parthenogenetic development of the egg cells of that plant.

But the man who works among Orchids will not be disposed to be so sceptical. He is aware of the fact that a fly or even specks of dust settling on the stigma may provoke changes in the flower similar to those which follow on pollination. A striking illustration is provided by the specimens of Odontoglossum crispum, bearing both normal white and canary yellow flowers, which are sent frequently to the *Gardeners' Chronicle* by growers who want to know whether the yellow flowers represent a sport. As is known to experienced Orchidists the latter colour is assumed by the flower as a consequence of pollination. It may also be induced, as the specimens show, by a contact-stimulus set up by dust or grit falling on the stigma. Having in view such facts as these and also their application to the case of Zygopetalum Mackayi, it will, I think, be of interest if I bring this paper to a close by describing the progress of attempts to unravel the several processes which are set going in the floral mechanism as a consequence of pollination.

All gardeners know that pollination does indeed set going a long series of changes in the flower and even in the neighbouring parts of the plant.

It is a well-known fact, for example, that many pollinated flowers wither more rapidly than unpollinated flowers.

So marked, indeed, is the difference between pollinated and unpollinated flowers in this respect, that it is worth while in the case of certain self-fertilised flowers to prevent pollination by the removal of the pistil or stamens.

Again, it is a notorious fact that some seedless fruits, certain Grapes, Currants, &c., do not swell unless they are pollinated. Pollination is useless so far as inducing seed formation is concerned, but it nevertheless fulfils the secondary purpose, in some seedless fruits, of giving rise to a chemical stimulus under which the fruit walls swell and become fleshy or succulent.

These illustrations, which might, of course, be multiplied, serve to demonstrate that pollination, beside bringing about fertilisation, sets up disturbances in the flower, and even in other parts of the plant.

The nature of these disturbances has been investigated recently in Orchids and other plants, and as a result of these investigations, although they leave much unexplained, we know definitely that pollination may bring about three types of events. First, fertilisation, of which we have treated already. Second, changes due to the contact of pollen with the stigmatic surface. Third, results which may be described as intoxications, or responses to chemical stimulation. Illustrations of marked results arising as the consequence of mere contact of the pollen with the stigmatic surface are exhibited by plants such as Mimulus, Orchids, and doubtless many others.

Place a little of its own pollen on the stigma lobes of Mimulus cardinalis, and they begin to close. If more pollen be placed on the lobes they close sooner, and remain closed longer. If much pollen be used in the experiment the lobes remain closed; if only a little be placed on the stigma, the lobes separate after a short time.

Careful experiments by Lutz have shown that the closing movement is due to a contact stimulus. As has been known for a long time, the closing movement of the stigma lobes of Mimulus and similar plants with sensitive stigmas may be brought about by stroking the surface of the stigma with the finger-nail or with a knife.

The cells of the stigmatic surface are in tension, and charged with water. The irritation, either by a load of pollen or by stroking or scratching, brings about a discharge of water from these cells. Those of the upper surface lose more, and contract more, and, shortening, pull the lower surfaces upwards till the lobes meet.

Any pollen, live or dead, will serve to bring about this closure, but unless the pollen used be alive and that of the species itself, the stigma lobes, after a longer or shorter interval, separate once again from one another. That is to say, the shrunk cells re-absorb water, return to their original size, and push the lower surface outward and downward.

But if a good load of pollen of Mimulus cardinalis be put on the stigma of a flower of that plant, the stigma lobes close, and open no more. Here we have an illustration of the second of our three results of pollination, namely, that of intoxication. I do not suggest that the failure to re-open means that the stigma of Mimulus is plunged in a drunken sleep; but that the failure of the lobes to separate is due to the fact that the pollen excretes a poisonous substance which brings about a disorganisation of some of the cells of the stigma, as a result of which they can no longer absorb water, hence cannot press back the appressed lobes. That this explanation is correct is demonstrated by the fact that a watery extract of the pollen suffices to bring about both a closure and a failure to reopen; the former by setting up a contact-stimulus; the latter by poisoning certain of the cells of the stigma, killing them, and thus rendering them incapable of absorbing water.

Toxic actions of this kind would appear to be the key to the explanation of many of the most curious phenomena bearing on pollination. It is well known, for example, that in certain Orchids, Oncidium flexuosum and others, to put the plant's own pollen on the stigmatic surface is to poison it. The flower withers prematurely and fails to set seed (see Darwin's *Annuals and Plants under Domestication*, vol. 2, p. 115).

It is just possible, as suggested by Fitting, that sterility may not infrequently be due to a similar cause, and that it might be worth the while of anyone who wished to obtain seed of a sterile form of Orchid, or other plant, to immerse the pollinia, or pollen, in water or a weak sugar solution for three or four hours, in order to remove the toxic substance before using the pollen for breeding purposes. Again, it appears probable that such a toxic action may be reciprocal; that is, that the stigma may, upon occasion, exercise a poisonous influence on, and so prevent the development of, the pollen. Here, again, artifice may perhaps be used to overcome the difficulty. If the stigmatic surface were wiped clean of its sticky fluid, and if, in place of that fluid, other from the stigma of the pollen parent were smeared on the stigmatic surface, it is possible that subsequent pollination might result in fertilisation. Only experiment can show whether either of these suggested methods would prove of use, and such experiments are for the botanist rather than the grower to carry out.

No plants show better than the Orchids the diverse effects of pollination, and inasmuch as these effects have been analysed carefully by Fitting, they must be described, albeit, briefly.

The chief changes induced by pollination of Orchids are: premature withering of the flower, swelling of the tissues of the column so as to enclose the stigmatic surface, swelling and greening of the ovary, and development of the ovules. Fitting worked with species such as Phalænopsis violacea and P. amabilis, the unpollinated flowers of which, in their native habitat, persist for a month or more. He showed that withering, as I have indicated already, is the result of contact-stimulus. It is induced when not only living, but also dead pollen, or even grains of sand, are placed on the stigmatic surface. Although the withering effect is due also to a contact or wound-stimulus applied to the stigmatic surface, the second consequence of pollination, the arching of the column over the stigmatic surface (fig. 198D), is not. This effect is not induced by sand or other fine particles, although it is produced by the plant's own pollen which has been killed by exposure to steam or chloroform. It is the result of a chemical stimulus or intoxication, as is proved by the fact that a watery extract of the plant's pollen, if put on the stigma, induces

Thus a little cotton wool which has been dipped in such an extract, suffices, when placed on the stigma, not only to produce withering by its contact effect, but also to produce the swelling of the column by its chemical effect.

Further, the swelling and greening of the ovary only occur after the pollen-tubes have grown some way down towards the ovary, and these changes are to be attributed to yet another chemical effect produced by substances excreted by the developing pollen tubes.

Such, in brief, are the facts which recent research has brought to light with respect to the significance of fertilisation, and the origin of the accessory effects of pollination. They show in graphic way what a highly organised mechanism is the flower. They indicate that it is attuned to respond in definite manner to different kinds of stimulation, and they prove that many responses on the part of the plant are called forth by definite chemical substances. Although our knowledge is yet too imperfect for it to be of evident service to the Orchid raiser, it is not without promise that it may throw light on the strange phenomena of sterility, and perhaps provide us with means of overcoming that refractoriness. Thus we may anticipate the making of yet more wonderful mongrels than those which now delight the amateur, confound the botanist, and confuse the student of nomenclature.

Mr. O'Brien said he was afraid that in the case of the Zygopetalum he was not in a position to carry the subject much further. As regards the general question of obtaining mature fruits by irritation of the stigmatic surface by means of grit or a similar substance, in the place of pollen, he could give particulars of some interesting experiments which he made some 40 years ago, in one of which fertilisation (proved by the withering of the labellum) took place even without irritation of the stigma. The subject chosen was Miltonia Russelliana, the least showy of the M. Clowesii section; the petals in this variety are thrust forward above the labellum, and guard the column from the approach of insects, unless the invader, in search of food, thrusts the petals aside. Mr. O'Brien said he had found that pushing aside the petals by means of a pencil had the effect of inducing the labellum to wither immediately, although the stigmatic surface had not been touched.

In fact, in this instance, and also in cases where fully-grown fruits were obtained without the use of pollen, there was evidence that the tissues concerned in reproduction acted as though proper fertilisation had taken place, and each function was duly carried out on this assumption, though fertile seeds were not produced.

That false fertilisation may occur also in a wild state was clearly indicated by the late Consul F. C. Lehmann, who, remarking on the comparative paucity of seed-vessels in the best type of Odontoglossum crispum, stated that he had nevertheless occasionally seen small batches laden with fruits, and that these were invariably to be found in exposed situations, where dust and grit were blown about in large quantities by the wind.

With regard to the flower of Phalænopsis, which Professor Keeble had shown with segments withering after fertilisation, this was of the P. Aphrodite section, which has membranous segments. The other section, having waxlike sepals and petals, did not wither, but the colour faded, the flowers becoming green, and in some instances indistinguishable from the foliage. In both cases, the principle was the same; that attractive features, when no longer needed, were dispensed with.

Obituary.

JAMES WATSON.—*Horticulture* records the death of this florist, at Settle, U.S.A. Mr. Watson, who was 77 years of age, was born in England.

WALTER S. NICHOL.—We learn from *The Florists' Exchange* of the death of this nurseryman at Barrington, Rhode Island, on the 12th ult. Mr. Nichol was a native of England, and accompanied his parents, who settled in America when he was five years of age. He was for two years Master of the Patrons of Husbandry and a member of the Rhode Island Agricultural Society.

MARKETS.

COVENT GARDEN, *December 11.*

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

Remarks—English Apples are arriving in very large quantities. Many of the varieties are keeping badly, and great difficulty is experienced in disposing of them; the varieties Dumelow's Seedling (Wellington) and Bramley's Seedling are exceptions. There are large consignments of Apples from Washington State and British Columbia, the fruits being well graded and attractively packed in boxes. Apples in barrels from Nova Scotia consist of the varieties Fallawater, King of the Pippins and Blenheim Pippin. Varieties from the United States are principally York Imperial and Albemarle, two popular sorts. Supplies of English Pears are finished. Imported Pears consist of the following varieties:—Doyenné du Comice, Winter Nelis, Glou Morceau, Easter Beurré and Keiffer. Oranges from Spain promise well; these fruits are arriving from Jamaica, California (Seedless), and the Canary Islands, whilst there is the small but popular Tangerine variety. English Gros Colman and Black Alicante Grapes are very plentiful indeed; the supply is abnormal for the time of the year. Muscat of Alexandria and Canon Hall Muscat are limited supplies, but there are sufficient bunches to meet the demand. Belgian growers are sending very good samples of Gros Colman Grapes. Teneriffe Tomatos continue to arrive in an excellent condition. Cobnuts and Brazils are dearer, but supplies and prices of other nuts are about the same as last week. Dwarf Madeira Beans received this week are of better quality. Supplies of Beans from the Channel Islands have been fewer during the past week. French vegetables, principally salads, have met with a better demand. Supplies of ordinary vegetables, with the exception of Cauliflowers, are much in excess of the demand. Holly and Mistleto are arriving in the market in large quantities. Holly is exceptionally well berried this year. *E. H. R., Covent Garden, December 11, 1912.*

Potatos.

	per cwt. s.d. s.d.		per bag. s.d. s.d.
Bedfords	4 0- 4 6	Dutch	2 9- 3 6
Kents	4 0- 5 0	Belgian	3 0- 3 9
Blacklands ...	3 6- 3 9	German	3 9- 4 9
Lincolns	3 6- 5 0	Dunbars	6 0- 6 6
King Edward ...	4 0- 4 9	Scotch (grey soil)	4 0- 4 9

Remarks.—Prices are about the same as last week, and trade remains quiet. Large numbers of Potatos are arriving from Holland, Germany and Belgium. *Edward J. Newborn, Covent Garden and St. Pancras, December 11, 1912.*

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending December 7, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather.*—The conditions were generally very dull and unsettled. Snow fell over all the north-western, northern, and eastern districts early in the week, and subsequently rain was experienced almost daily in Ireland and the west and north-west of Great Britain, and rather frequently in the south and south-east. In the east of Scotland, however, the major portion of the period was dry. Thunder and heavy hail occurred at Bath on the 6th.

The *temperature* was low at the commencement of the period, the thermometer falling to 8° in Scotland E. and England N.W. to 11° in Scotland W. and 15° in Scotland N., and to about 20° in many other districts. In the English Channel, however, the lowest reading was 35°. After the 1st the temperature fluctuated rapidly, but was generally above freezing point except for a time in Scotland. The highest of the maxima, which were recorded at most stations on the 4th, ranged from 57° in England N.W. and over Ireland to 51° in Scotland N. The temperature as a whole was below the average in Scotland and in England N.E., and above it elsewhere. The lowest grass readings were 4° at Worksop, 1° at West Linton and Newton Rigg, 10° at Burnley, Aspatria, and Blackpool, and 11° at Glasgow and Southport. The temperature of the soil at a depth of 1 foot was below the normal at all stations, and was also below it at many stations at a depth of 4 feet.

The *mean temperature of the sea.*—On nearly all parts of the coast the temperature of the water was below the normal, and in most places it was lower than during the corresponding week of last year. At Plymouth, Scilly, and Seafield the means for the week ranged from between 50° and 51°, but at Cromarty it was only 39°.

The *rainfall* was less than normal in Great Britain, above it in Ireland. On the 3rd as much as 0·9 inch fell at Fort William, followed by 1·7 inch on the 4th.

The *bright sunshine* was less than the average. In Scotland W. and at several stations in the Midlands and north of England there was none. In England N.E. the mean daily amount was only 0·1 hour, and in England N.E. 0·2 hour. The highest percentage of the possible duration, 17 and 15, occurred in Ireland S. and England S.E.

THE WEATHER IN WEST HERTS.

Week ending December 11.

Six days in succession of the same temperature.—The past week has been warm almost throughout, both during the day time and at night. For six consecutive days the highest reading in the thermometer screen only varied 1°, from 50° to 51°. On the warmest night the exposed thermometer only fell to 38°, which is 10° higher than the average minimum reading of that thermometer for the month. The ground is now 2° warmer at 2 feet deep, and 4° warmer at 1 foot deep, than is seasonable. Rain has fallen on each of the last six days, but to the total depth of only about half-an-inch. During the week 3½ gallons of rainwater has come through the bare soil percolation gauge, and 3 gallons through that on which short grass is growing. The sun shone on an average for only six minutes a day, which is more than an hour a day short of the mean duration for the same period in December. There were five sunless days, and on the brightest day the sun shone for only 25 minutes. Light airs as a rule prevailed, the direction of those light airs being principally some point between S. and W. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 5 per cent. The last Rose bloom of the year growing in the open ground in my garden was destroyed by rain on the 9th inst., or five days earlier than the average date of its destruction in the previous 27 years, and seven weeks earlier than last year. *E. M., Berkhamsted, December 11, 1912.*

ANSWERS TO CORRESPONDENTS.

Anthurium: *J. C. N.* The specimen is a normal inflorescence of Anthurium magnificum, with its long, narrow bract. The plant is usually grown for its large, handsome foliage, and as the inflorescences are unattractive they are usually pinched out when young to give increased vigour to the leaves. From your question "as to when it can be induced to produce its red flowers," we suspect that you have confused the plant with either A. Scherzerianum or A. Andreanum. In any case your plant will not produce any other kind of inflorescence than the one you send us.

Book: *C. S. & Co.* The text in the 3rd edition of *Systema Horti-cultural* differs only here and there from the 1st edition, but it includes in addition a short chapter on seasons of sowing, and also the "Gardener's Monthly Directions." There is another edition which includes chapters on "A Catalogue of Seeds, &c.," another of "Housed Greens, &c." "Sold by Mr. George Rickets, Gardener at the Hand in Hogsden without Bishopsgate, London, the Great Collector and Improver of the Beauties of a Garden." Your copy being dilapidated may be worth from 8s. to 10s.

Chrysanthemums for South Africa: *J. B. K.* You will experience considerable trouble in exporting Chrysanthemums to South Africa, for it may be necessary to first obtain a permit from the Governor or Consul General of the district. Small, hardy, well-established plants will best survive the journey, which occupies three weeks. Practically all varieties do well in that country. Your best plan is to send them through some trade grower who has experience in dispatching plants to that country.

Diseased Cattleya Leaves: *E. B.* We have been successful in rearing the adult insects from the first specimens which you submitted for examination. The insect is one of the small flea-beetles belonging to the Halticidæ, and is in many ways related to the Turnip flea-beetle Phyllotreta nemorum. Like the latter, it possesses the power of jumping, flying and feigning death. It seems, moreover, to complete the whole of its life cycle within the leaf, so that it is difficult to advise any practical means for its destruction. Insecticides applied to the surface of the leaves would not destroy the insects in the interior without seriously or permanently injuring the plant. Fumigation with hydrocyanic acid gas might possibly destroy the beetles, but the best plan is to burn the infested foliage.

Grape Vines: *T.C.* Vines should receive an annual cleansing. Mealy bug, red spider, and thrips are the chief pests of the Grape, and these insects or their eggs may be concealed in the bark whilst the vines are dormant. The pests will increase rapidly when forcing is commenced. If the vines are quite clean you need not remove the outer bark, but as a precaution the rods should be scrubbed thoroughly with a stiff brush.

Grapes: *J. C.* The shrivelling is not due to the presence of either a fungus or an insect, and must be the outcome of something affecting growth.

Hedychium Hybrids: *Dr. R. F. S., Bombay.* The hybrid Hedychiums mentioned in the article on the tropical Water Lily house at Kew (p. 294) cannot be obtained from nurserymen, as they are not in commerce. The authorities at Kew often exchange plants; you should therefore write to the Director for small portions of these hybrids, offering something in exchange. You may be able to offer Indian plants in exchange.

Late Dessert Apple: *J. D. C.* Your difficulty in keeping dessert Apples without shrivelling may be due to gathering the fruits before they are perfectly ripe. If you wish to keep dessert Apples until late in the season the fruits should be thinned and the crop allowed to remain on the trees for as long a time as possible. The trees need to be mulched and well watered in summer. The fruit room should not be too dry; it is a good plan to place the fruits on damp bricks. Certain varieties are more liable to shrivel than others. Those you name are amongst the best keepers, but you might try the following sorts:—Sanspareil, Old Winter Nonpareil, March Pippin, Lord Hindlip, King of Tompkins County (this is rather a delicate variety, but it is worthy of a trial), D'Arcy Spice, Allen's Everlasting, and King's Acre Pippin.

Lily of the Valley Unhealthy: *G. M.* No disease is present: the trouble is due to some wrong cultural treatment.

Names of Plants: *Burton.* 1, Pseudotsuga Douglasii; 2, Cupressus Lawsoniana; 3, Thuya plicata; 4, Abies Nordmanniana; 5, Picea Alcockiana; 6 and 7, Cupressus Lawsoniana var.; 8, Cedrus atlantica glauca; 9, C. atlantica; 10, Cupressus nootkatensis var. pendula; 11, Juniperus sp., perhaps a form of virginiana; 12, Picea alba; 13, Tsuga Pattoniana; 14, a glaucous form of T. Pattoniana; 15, Cupressus Lawsoniana. [Thanks for donation of 2s. 6d. for R.G.O.F. box.—Eds.]—*W. B.* Ornithogalum lacteum. Sprays are often put on board the mail steamers at Cape Town and arrive in England in fresh condition.—*E. H. M. H.* Impatiens Sultani.—*F. T.* 1, Epidendrum nemorale; 2, Oncidium candidum.—*J. W. W.* Ornithogalum lacteum.

Palm Leaves with Brown Tips: *W. B.* The trouble has been caused by some check to the plant. The removal of 12 large leaves may have caused the damage, but brown tips on the leaves are generally the result of improper watering. Two much or two little moisture at the roots results in the leaves dying at the tips. An excess of manure, a dry atmosphere, and cold are contributory causes.

Pines: *J. W. Wilson.* We believe that the spherical objects attached to the leaves of the Pines are the eggs of some kind of spider, but they were crushed, so that we cannot be absolutely certain as to their identity. Place uninjured eggs in a glass vessel plugged with cotton wool, and allow them to hatch.

Pruning Thuyas: *A. S.* The Thuyas and Retinosporas may be hard pruned at any time during the winter when the weather is mild, but the earlier the work is done the better will be the results.

Raspberry Canes: *G. E. G.* The white patches are caused by a destructive fungus, Hendersonia rubi, which also attacks the Loganberry. Spray the plants with Bordeaux mixture twice before the flowers open. Old canes should be removed as soon as possible after the crop is gathered, to prevent the disease spreading to the younger canes.

Retail Fruit, Flower and Vegetable Business: *N. J. F.* The amount of the turnover mentioned in your note is fairly satisfactory for a small business of this kind, provided it is a correct weekly average. If the shop is situated in a good district of the large town you mention, and an examination of the books shows conclusively that a good profit may be made, you might safely embark in the business. Your capital is sufficient seeing that the business is a ready-money concern.

Richardia Dying: *Thanet*: The roots are injured by the fungus Rhizoctinia. Cut off the diseased roots, and repot the plant in soil containing a small quantity of flowers of sulphur.

Rose Sinica Anemone: *C. P.* It is not uncommon to find an occasional flower of this variety late in the autumn, but not such numbers as you describe. The general method of flowering of this Rose is not unlike that of the Multiflora and Wichuraiana varieties, that is the flowers are normally produced on the end of short laterals proceeding from the strong shoots of the previous year. Late in the season one or two buds on these sub-laterals behind the node that has flowered frequently put out fresh growths carrying a few leaves which are evidently potentially flowering shoots, although the majority of them are sterile, or come blind. Now and again one of these shoots from the sub-laterals will carry a bud which is capable of opening if the weather is favourable.

ROSES AND MAGNESIA.

IT is possible that it may be worth while for Rosarians to devote attention to the influence of magnesia on Rose culture. This substance has long been known to occur in plants, but it has generally been considered either of no value to the plant or positively harmful. For instance, experiments had indicated that magnesium carbonate was inimical to the germination of seeds (Watts), and Kearney and Cameron had shown in America that salts of magnesia possess, even in solutions of great dilution, a toxic action upon plant roots, which effect, however, was diminished in the presence of salts of calcium; Loew's experiments indicate that excess of magnesium over calcium results in a sterilising effect on the soil, and Hall, in commenting on this, draws attention to the fact that soils resting on serpentine, a mineral containing magnesia, are notoriously poor, and also points out that certain very impoverished clays on the Wealden formation contain a high proportion of magnesia.

Nevertheless, so long ago as 1889, Mr. E. Tonks's well-known paper in the *Rosarians' Year Book*, relying on a table from Wolff's "Aschen Analysen" (Berlin, 1871-1880), recommended a manure for Roses containing sulphate of magnesia in the proportion of two parts to 33, with, however, an excess of lime salt. There the matter seems to have rested for 20 years. In 1909, M. Georges Truffaut, in a paper which appeared in a contemporary, noted the large proportion of magnesia found in the analysis of Rose plants, and stated that while soils in which magnesia is deficient produced but a weak growth of Roses, the addition of magnesium salts as a manure brought about a marked increase of vigour and growth. About the same time a writer in the *Journal* of the French National Horticultural Society recommended the application of nitrate or sulphate of magnesia to weakly Roses which refused to respond to treatment with ordinary manure, stating that dressings of these salts in soils deficient in magnesia had been attended with satisfactory results.

The following year (1910), at the International Rose Conference held in Paris, the particular value of magnesia in the nourishment of Roses was one of the subjects for discussion; the importance of its influence was insisted on, and magnesium was declared to be indispensable for Roses. It was stated that it should be given always in the form of the sulphate, in doses of 200 grams to the metre (about 5 ounces to the square yard): kainit, an impure mixture of chloride and sulphate of potash, which contains about 12 per cent. magnesium, being recommended. One speaker, however, declared magnesium chloride to be poisonous to Roses. This directed the attention of foreign rosarians to the subject, and there seems to have been an idea that a particular effect of magnesia on the Rose was to cause the development of the receptacle, or seed envelope.

M. Leon Civet, in 1911, made some observations as to the effect of magnesium and manganese on 428 dwarf Roses in 23 varieties, mostly Hybrid Teas, planted in the rosary at Château de Saint-Maximin (Oise), and reported that, notwithstanding the very hot summer, 410 of these Roses had grown well, 10 rather feebly, and eight not at all, while the flower production was uninterrupted throughout the season. Having regard to the facts that the plants were all young, and that the temperature was excessive, he considered the result from the point of view of the growth of the Roses very satisfactory. For our present purpose the additional complication introduced by the manganese is perhaps to be regretted.

In the same year we have a record given in the *Journal des Roses* of some most interesting experiments by M. Cochet-Cochet. They are three in number, and most carefully recorded. The first of these was made with a batch of plants of Ulrich Brunner in pots. The plants were divided into three lots. Lot 1 was watered with pure water, lot 2 with a solution of ammonium nitrate 0.217 grams to the litre (or, roughly, ¼ ounce to the gallon of water), and lot 3 was watered with a solution of nitrate of magnesia, 1 gram to the litre (or, in round figures, an ounce to the gallon of water). The waterings were continued throughout the growth of the plants, varying in amount according to the dryness and temperature, but so proportioned that each pot received the same amount of liquid. In the autumn he obtained the following results: lot 1 was much the worst, lots 2 and 3 were of about the same vigour, but lot 3, which had received the magnesium, held the lead well, and on taking them from their pots, the root system was found better developed than in the case of the other two lots.

The second experiment was made with 1,800 plants of De la Grifferaie stocks intended for budding, planted in ground manured in the ordinary way, and divided into two plots. One of these plots, in addition to the manure, had received a dressing of finely-powdered carbonate of magnesia obtained from the dolomite formation, and therefore containing lime in considerable quantity. This was applied at the rate of 20 kilograms per acre (about 11 lbs. to the pole, or 8 cwts. to the acre).

Planting was done in April, and down to July no particular difference between the two plots was noticed. At the beginning of August, however, the plants on the plot treated with magnesia suffered arrest of growth for a time, and when they were budded on August 25, they were decidedly less tall than the plants on the control plot, the difference being, on the average, some 8 inch (20 cm.). The plants continued their relative rates of growth for a time after budding was finished, when suddenly about 60 per cent. of plants treated with magnesia commenced to make new growth from the stems where they were bent over, and this new growth continued late in the season, so that towards the middle of January they appeared from a distance still covered with leaves, though the Roses on the control plot had lost all their foliage. In the following year (1911) the Roses developed normally from the buds, but the extreme dryness of the year prevented accurate account being taken of the result of the experiment. At the same time, the Roses in the plot treated with magnesia were decidedly superior to those on the control plot, being both taller and more sturdy.

The third experiment was undertaken to ascertain whether the improvement in the magnesia-treated plot in the second experiment was due to the admixture of lime in the dolomitic magnesium carbonate. Two plots each of 1 are (109 square yards) were treated, the one with 12 kilos. of dolomitic magnesium carbonate and the other with such a quantity of carbonate of lime that the amount of carbonate in each plot should correspond. These were planted with De la Grifferaie stocks, and gave similar results to those of the second experiment, the plants in the magnesium plot again making late growth and retaining their leaves to the middle of January. M. Cochet-Cochet concludes: (1) that magnesia exercises a definite influence on the growth of Roses, and (2) that employed in the form of carbonate to the Grifferaie stock, it augments development and prolongs growth into the autumn, enabling the plant to retain its leaves in an abnormal manner.

Reverting for a moment to the analysis of the ashes of Roses, Wolff found magnesia distributed in the plant in the following proportions: Roots 7.15, wood 7.62, leaves 9.23, and flowers 5.94. That is to say, the leaves contain a far greater proportion of this substance than any other part of the plant. If, then, analysis is any guide, we should expect the effect of treatment with magnesium salts to produce its greatest effect in the foliage, and this appears consonant with M. Cochet-Cochet's results. It is, moreover, to some extent confirmed by recent experiments which have shown magnesia to be a constituent of chlorophyll.

It was formerly thought that any beneficial effect of magnesia was probably due to its action in liberating potash, but from the presence of the salts in the quantity in which it is found in the Rose, and from the above experiments, this view must be abandoned, and it must now be admitted that it produces a definite and independent effect, which may be better understood after further experiments. *White Rose.*

NEW OR NOTEWORTHY PLANTS.

GERBERA HEDERÆFOLIA* (DÜMMER).

AN acaulescent herbaceous plant. Leaves radical, tufted (five to a tuft), petiolate, ascending; petiole very stout, sheathing at the base, $1\frac{3}{4}$ inch to $3\frac{1}{2}$ inches long, thickly white-lanate all over; blade triangular, obtuse at the apex, deeply cordate and rounded at the base, $1\frac{1}{4}$ inch to $2\frac{1}{2}$ inches long, 1 1-12 inch to $2\frac{1}{6}$ inches broad, thickly coriaceous, light green and glabrous at maturity above, thickly white-lanate below, the midrib and obsolete lateral nerves sunken on the upper surface. Scape solitary and slender, bearing one flower-head, nude, 9 inches long, white-lanate. Flower-head when expanded $2\frac{1}{2}$ inches to 3 inches in diameter, the involucral bracts, one to two-seriate, lanceolate, acute, about 5-12th inch long, sparingly white-woolly externally, brown tipped. Ray florets yellowish, four nerved, 1 inch to $1\frac{1}{2}$ inch long, $\frac{1}{6}$ inch to $\frac{1}{4}$ inch broad. Achenes glabrous, surmounted by white pappus.

In the form of the leaves, G. hederæfolia, as is implied by the specific name, has a striking resemblance to those of the common Ivy, except that the under surfaces are covered with a dense snow-white woolly felt, which admirably harmonises with the pale-green tint of the opposing side. The species is an acceptable acquisition to the few Gerberas obtaining in China, and was discovered by Mr. Wilson in Western Hupeh, Central China, in April, 1901.

SCOTLAND.

EDINBURGH DISTRESS COMMITTEE'S ESTABLISHMENT AT MURIESTON.

FEW Labour Distress Committees in Scotland have achieved such good results as the Edinburgh Committee. The land was formerly valued at only £1 per acre per annum, whereas that which has been reclaimed is now valued at £25 per annum, and a considerable portion of the estate has been disposed of for market-gardening. By invitation of the committee, a party of about 200 recently visited Murieston. A new departure is to be begun by the establishment of a colony for lads, who are to be taught market gardening and farm work. An influential representative committee has been formed, and the sum of £200 has been already subscribed.

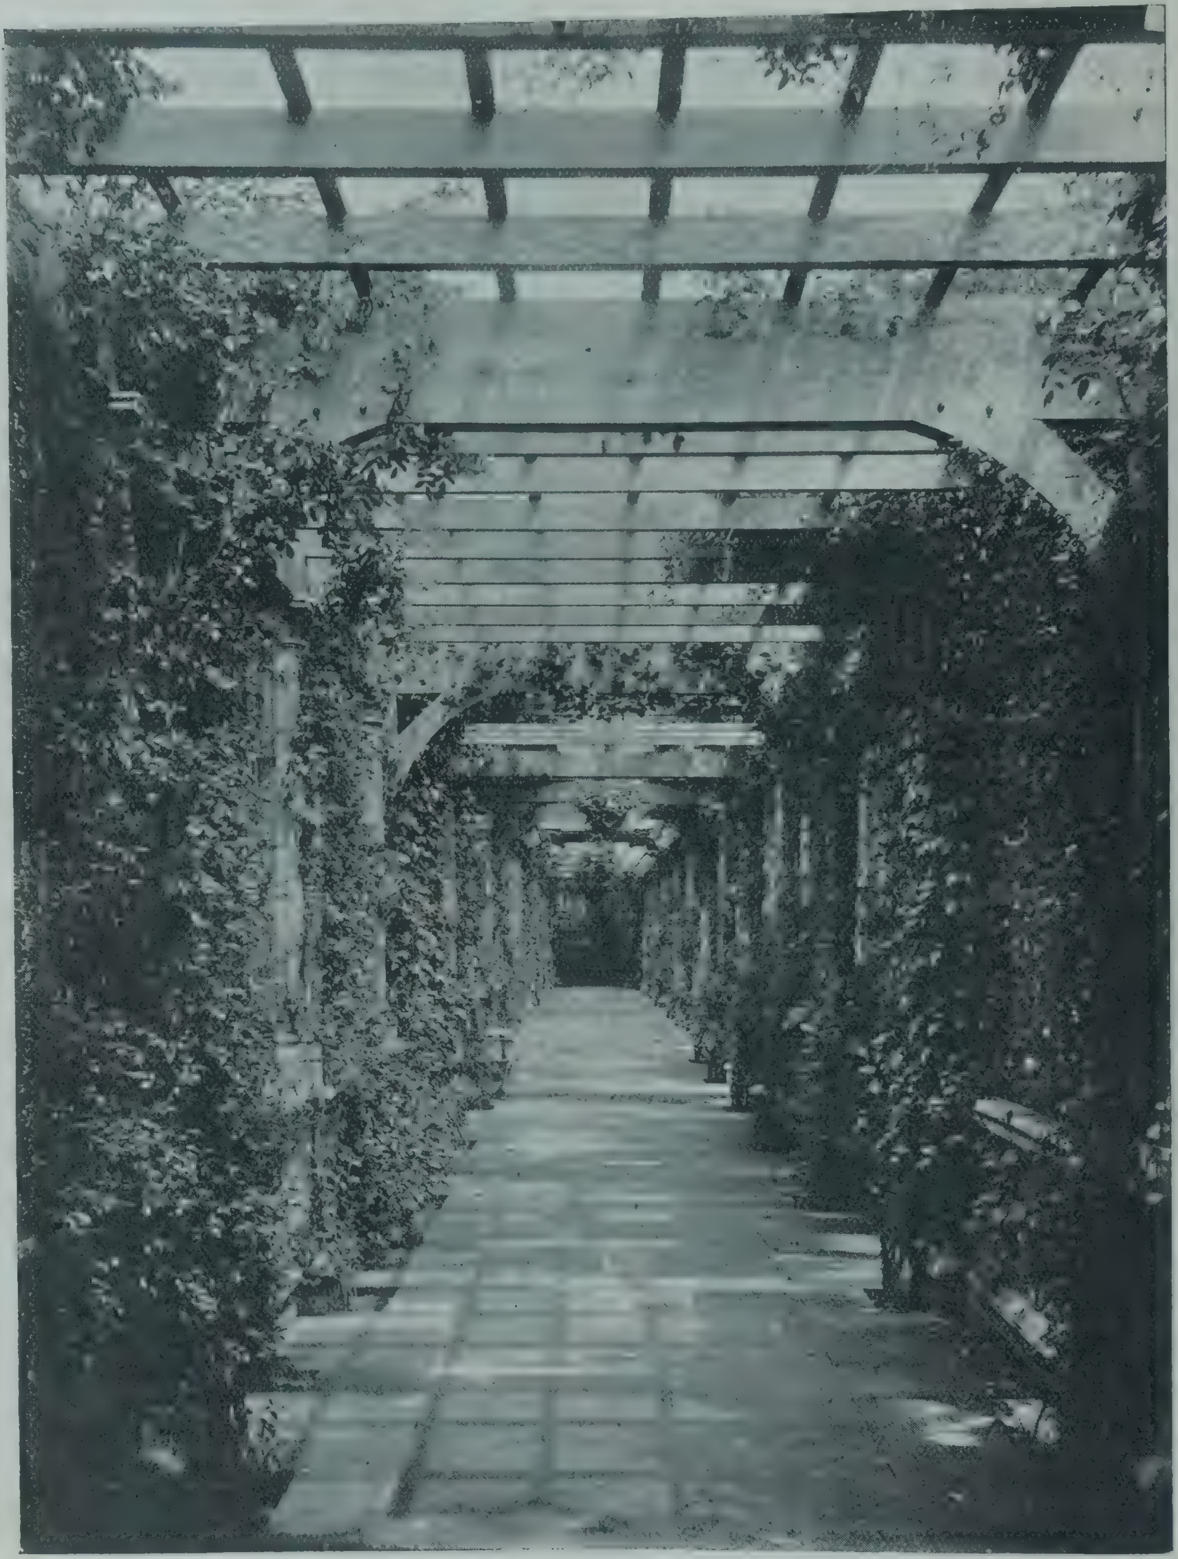
AFFORESTATION ON ARDGOIL.

THE question of the afforestation of a portion of Ardgoil belonging to the Glasgow Corporation has been under consideration for some time, and a report on the subject was laid before a meeting of the general finance committee recently by Mr. James Whitton, superintendent of the city parks, and Bailie Alston. Three areas in the vicinity of Lochgilphead were suggested as a beginning, and these comprised in all about 1,100 acres. The most suitable was one of about 200 acres, and the estimated cost £1,500. The committee agreed to recommend that this be undertaken, that Mr. Whitton be authorised to prepare a detailed scheme, and that plants for the other areas be drawn up for further consideration. *Correspondent.*

THE HILL, HAMPSTEAD.

(See figs. 209, 210 and Supplementary Illustration.)

THE London residence of Sir William Hesketh Lever is situated on the edge of Hampstead Heath, a couple of minutes walk from the famous "Jack Straw's Castle" hostelry. The front entrance to the house gives no indication of the fascinating beauty of the garden, and once inside the gates the visitor finds it difficult to realise that the garden is very limited in size, and so near to the city of London. The front of the house, which has a sharply-pitched roof with dormer windows, is strongly suggestive of the French château. Along the front is a broad verandah which looks out over the two lawns and away to the pergolas. Against the front of the verandah and the walls of the wing, which bears several very handsome, large, leaden water-heads, there are many climbing shrubs. Magnolias are especial favourites, and to obtain as long a season as possible the deciduous, spring-flowering Magnolia conspicua has been planted in close proximity to the later evergreen M. grandiflora, and the growths are being intermingled.



[*Photograph by H. N. King.*

FIG. 209.—PERGOLA AT THE HILL, HAMPSTEAD.

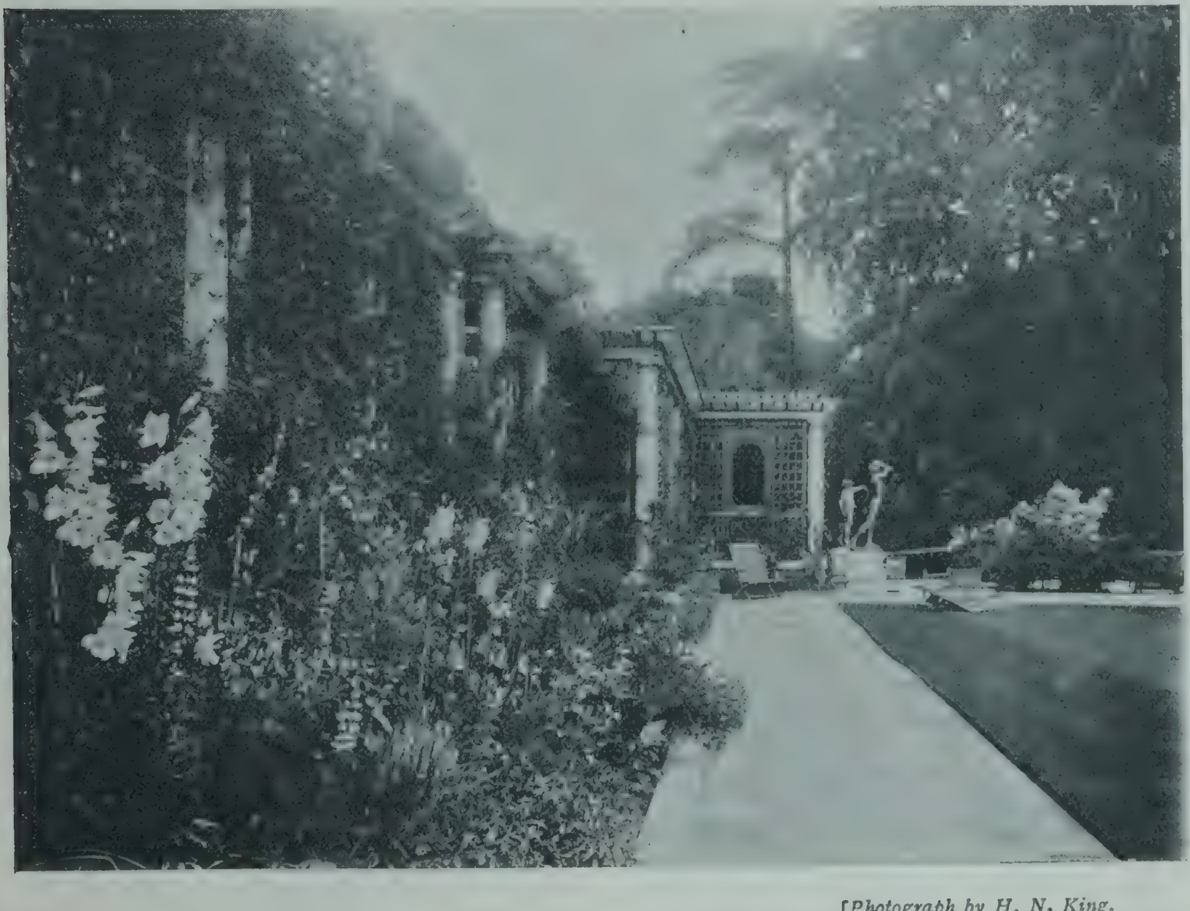
THE PERGOLAS.

When Sir William Lever acquired The Hill the garden was very steep and possessed no distinctive characters of importance. The cutting of the Hampstead Tube Railway gave an opportunity for obtaining many thousands of loads of soil, and the steep hillside was transformed into a plateau which made possible the delightful, cool, restful, level lawn and the stretch of handsome pergolas which form the subject of the lower half of the Supplementary Illustration. As will be seen these pergolas are in the Italian style; the columns are of Portland stone, and the beams are of English Oak. The lattice work, sides, and the cross-beams are furnished with such climbing plants as Wistaria sinensis, Jasmines, Pyrus japonica, various Clematis hybrids, Crimson Rambler, and Dorothy Perkins Roses, but these plants are not allowed to cover entirely the pergola and so hide its splendid proportions. The design of the woodwork at the ends (see fig. 209) is a triumph of the draughtsman's skill, the perspective was so cleverly drawn that even when standing within 2 feet of the work it is difficult to realise that one is looking at a plain surface and not into an alcove. Altogether, the broad, paved floor of the well-designed pergola, lightly covered with beautiful plants, permitting views on one side of the Heath and of the smooth, green lawn which surrounds the green-tiled Water-Lily pond, forms a most pleasant promenade as well as a gracious ornament to the garden. When complete, the Pergolas at The Hill will be unique, for the extension is being made on a large scale.

---

* Species nova. distincta, Hederæ foliis simillimis supra deinde glabris subtus dense albo lanatis, scapo gracili nudo albo-lanato, facillime distinguenda. (Wilson, 1834, Herb., Kew.)

Were it not for the fascinating pergolas the lawns would claim all one's attention and admiration. The lower lawn is quite level, and the herbaceous borders which divide it from the pergolas provide a handsome setting during the season. Here are grown the best plants for making a bright display throughout the summer months. On the right-hand extremity of the lawn there are large-spreading Oak and Beech trees, which cast a pleasant shade and tell of the many years which have come and gone, but which are the despair of the gardener who endeavours to induce plants to grow on the ground beneath them. The statuary in the garden is of exquisite workmanship, the bronzes, by Onslow Ford, are magnificent, and the dolphin fountain in the middle of the Water Lily pool arrests attention.



[Photograph by H. N. King.

Fig. 210.—VIEW IN THE GARDENS AT THE HILL, HAMPSTEAD.

The retaining wall of the lower terrace is clothed with Roses, Ceanothus, and Jasmines, and a broad flight of steps with low and easy tread leads up to the higher terrace and its bordering of flower-beds which in summer blazed with Paul Crampel Pelargoniums, and were filled with Wallflowers, Forget-me-Nots, and a variety of spring-flowering bulbs.

Below the pergolas, on much lower ground, there are the glasshouses and frame yard. The chief feature of The Hill is the outdoor garden, and the glass is not extensive; its principal use is to supply plants for the house and for filling the flower-beds in the early summer. Much of the frame-yard, and what should have been flower-borders, was in a state of chaos on the occasion of my visit, owing to the extensive building operations in connection with the pergola extension. This condition is viewed by Mr. J. Barton, who has been in charge of the gardens for the past three years, in a philosophical light, for it is unavoidable. Before taking charge at The Hill, Mr. Barton was for nine years engaged latterly as foreman, at Thornton Manor, Sir William Lever's Cheshire estate. Building operations are a hindrance to good gardening, but Mr. Barton was looking forward to their completion, when he would be able to bring this part of the garden into as good a condition as the remainder. *A. C. B.*

NOTICES OF BOOKS.

FRUIT FARMING.*

As a handbook on commercial fruit-growing we commend this work as the most comprehensive, practical, and useful of its class that we have seen. It is literally packed with detailed information upon all branches of its subject, and is profusely illustrated. The author has long been known for his writings upon the subject, and particularly in relation to the financial aspect of the fruit industry. In preparing the present handbook, moreover, he has had the valuable assistance not only of some of the most capable and experienced of fruit-growers, but also of such specialists on the scientific aspects of his subject as Mr. George Massee, Dr. Bernard Dyer, and Professor F. V. Theobald, who, in common with Mr. Geoffrey J. Hooper and other fruit-growers, contribute sections of the work. The arrangement of the sections is not so systematic as it might be, probably owing to the fact that most of them have been previously published separately. This defect gives the book a somewhat disjointed appearance; but the reader will find the information he needs readily enough by means of the index. Beginning with the training of the fruit farmer, the author proceeds to deal with the capital required, the selection of a farm, the previous cultivation and setting out of fruit plantations, the planting and treatment of the various fruits, pruning, spraying, picking and packing, pollination, book-keeping, cover crops, beasts and birds in relation to the fruit-grower, approximate cost of cultivation, regrafting, protection from frost, and many other subjects. Chapters are contributed by Dr. Bernard Dyer on the manuring of fruit trees and bushes; by Geoffrey F. Hooper on the commercial cultivation of the Loganberry, preserving factories, and the future of fruit-growing in Great Britain; by F. V. Theobald on some insect pests of fruit and insecticides; by George Massee on diseases of fruit crops; by Arthur Miskin on spraying with lime and sulphur; by Spencer N. Pickering and F. V. Theobald on a spraying calendar; by H. H. Mason on co-operation for fruit farmers; by O. B. Cowley on some legal points; by T. J. Poupart on packing and grading for market; by B. T. Barker, M.A., on cider orchards, and on Apple jelly by Miss A. Elrington. The only important branches of the subject which appear to have been overlooked are of shelter for fruit trees and bushes and fruit thinning. It must be added that, as the author admits, pruning is not sufficiently treated. A great many estimates of the expenses and returns of various crops and of cost of cultivating operation and picking fruit are given. One of the great merits of the book is its thoroughly up-to-date information, though exception must be taken to the cost of Apple trees at 1s. each, which is double the price of good two-year-old trees purchased in quantities, while maiden Apples, now being planted extensively, are cheaper still. On some of the points dealt with there are differences of opinion even amongst experts; but, generally, the advice appears to us to be thoroughly sound.

FRUIT GROWING FOR BEGINNERS.*

This is, as described on the title page, "a simplified and concise handbook on the cultivation of fruit," and it contains some illustrations. Advice, mostly sound, is given upon the treatment of all kinds of fruit commonly grown, and a good feature of the work is a summary at the end of each chapter, repeating in very brief and plain terms the principal points of the chapter. Grafting, budding, and pruning are explained with the help of illustrations, also a limited number of insect pests. Generally the advice as to pruning seems to us sound, though objection must be taken to the recommendation to leave only three or four buds when Apple trees are spurred in summer-pruning, and no more than two in the following winter pruning. Six and four would be preferable, until a fruit-bud has been formed, as excessive closeness in spurring leads to a profuse growth of spray. A sensible caution is given to persons thinking of engaging in fruit-growing as a business, misled by glowing, but untrustworthy, statements of great profits. The author points out the need of experience before a man launches out on his own account. There is much good advice in general terms; but in a shilling handbook dealing with all the most common fruits full details are hardly to be expected. *Southern Grower.*

ORCHID NOTES AND GLEANINGS.

LÆLIO-CATTLEYA CICELY.

A very interesting cross between Cattleya Forbesii and Lælia cinnabrosa (Lælia cinnabarina × L. tenebrosa) has flowered with Mr. Eustace F. Clark, Eveshot, Dorchester, who submitted an inflorescence to the Orchid Committee at the R.H.S. meeting on the 3rd inst The parentage is clearly discernible in the severa flowers borne on the tall scape, which, in habit displays the influence of L. cinnabarina. Th reddish-orange colour of this species (as is usua when this plant is used as a parent) is also present The flowers are about 4 inches across, the sepal and petals narrow and nearly equal; the colou is apricot-yellow tinged with a reddish hue. Th narrow and tubular lip has a small, rounde front lobe, and is formed similarly to that c C. Forbesii.

THE FERNERY.

INDUCED APOSPORY IN FERNS.

SINCE the first discovery of apospory by the present writer in 1884, it has been found that this phenomenon, namely, the production of prothalli direct from the frond, without the intervention of the spore, has presented itself in several forms, such as soral apospory, in conjunction with the aborted sori or spore heaps, or apical apospory, by simple extension and modification of the frond tissue itself. It had so far, until Professor Goebel's investigations,[*] been confined to otherwise abnormal varieties, and on some of these apospory only presented itself or could be induced to appear under special cultural conditions. Thus, in the case of Athyrium filix-fœmina var. unco-glomeratum, Dr. F. W. Stansfield has shown that, despite the quite deciduous nature of the species, the extremely comminuted crests retain vitality through the winter under close culture, and produce both bulbil and aposporous outgrowths in the following spring. Professor Goebel's investigations lead, however, far beyond this, since a considerable number of quite normal species are found to produce aposporic and apogamic prothalli, as also simple asexual plants, if the primary or first fronds produced from the prothallus are severed therefrom and layered on sterilised turf or loam. Among the plants so treated he mentions particularly Aneimia Dregeana, Alsophila van Geertii, Ceratopteris thalictroides, Gymnogramme chrysophylla, Polypodium aureum, and Pteris longifolia, of most of which he gives illustrations showing the diverse methods in which these regenerative outgrowths appear on the layered primary fronds. Since, however, these species were taken purely by chance from a large collection, the presumption is justifiable that the great majority of species possess the same regenerative faculty, though it appears to be confined to the first fronds, in which a hard-and-fast line between the gametophytic and sporophytic generations does not yet appear to be drawn. Hence, when the normal process of growth is interrupted by severance from the prothallus, and favourable conditions are afforded, the constituent cells produce outgrowths, sometimes presenting the prothallus character, sometimes the frond character, and sometimes an intermediate state in which stomata, a definite frond character, are in close juxtaposition with antheridia, an equally definite feature of the prothallus. At the time of Professor Goebel's report, none of the induced prothalli had produced plants, which he imputes rather to cultural conditions than to incapacity. None of the illustrations show archegonia, and only one antheridia, though in one of these the antherozoids are developed. He anticipates that when a second generation appeared it would probably be an apogamous one; but since apospory has been shown to be capable of producing perfect bisexual prothalli—A. f.-f. Clarissima to wit—in more than one instance, though in most cases the progeny are imperfect and weakly, it is reasonable to expect that like exceptions will crop up when the cultural-inducing experiments are extended.

The practical value of these discoveries to the Fern cultivator are not so far obvious, since once the prothallus has produced its primary frond the propagator has attained his object; but, to the biologist, they are of undoubted importance, as confirming the indication already afforded by apospory, that the line between the two generations represented by prothallus and frond-bearing Fern is more or less undefined, and there is doubtless much to be learnt by such cases as are here concerned, regarding the nuclear conditions of the cell, which determine the subsequent difference of growth. *Chas. T. Druery, V.M.H.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to Lady NUNBURNHOLME,
Warter Priory, Yorkshire.

PEACHES.—If the trees are not already detached from the wall, they should be untied, pruned, and secured firmly against strong winds without delay. Provided superfluous shoots were removed as recommended in previous notes, the winter pruning will be a simple matter, for only faulty shoots, which may have escaped notice when the foliage was still on the trees, need to be removed. If scale, red spider, or any other insect pest is present on the bark, the main stems and branches should be washed thoroughly with a moderately strong insecticide; use the specific at a less strength in the case of the young shoots. Do not wash the trees during very cold weather, but choose a mild, fine day for the work. The walls should be syringed well, and again before the buds begin to swell. If the trees are infested with red spider, a few handfuls of flowers of sulphur will be advantageous. In connection with the tying of the trees, it is well to remember that one of the secrets of success is sparse training; the shoots should be trained at 5 or 6 inches apart. Many gardeners adopt the plan of tying the shoots in winter to light poles about 1 foot from the wall, with the object of retarding the growth. If this is done, the shoots should be separated, not tied in large bundles.

APRICOTS.—If convenient, the trees should be pruned before the end of the year. The Apricot is subject to a number of insect pests, and it will be necessary to wash the trees thoroughly with good insecticide; the walls must also be subjected to the same treatment. The roots may be left undisturbed, provided they are growing in a restricted body in rather poor soil. Root-pruning will check gross growth in young trees, but prevention is better than cure, and it is wise always to plant in poor soil, mixed with plenty of lime rubble. A rich rooting medium is a frequent cause of canker, and, when once a tree is attacked by this insidious disease, it is most difficult to restore it to health.

RASPBERRIES.—Provided the old canes and superfluous suckers were removed directly after the fruits were gathered, no pruning will be necessary. The annual mulching should be applied as soon as possible, since the winter rains will wash the manurial properties into the soil, enabling those canes which are left in position to avail themselves of the nourishment provided. The manure should be spread over the roots on the first frosty morning; it should be liberally applied, since food is essential to strong growth. The manure should be allowed to remain on the surface, since digging would injure the roots. If for any reason planting has been delayed, this work should be postponed, at any rate for the next two months.

NUTS.—Nut bushes are often grown in out-of-the-way corners and allowed to remain unpruned for too long a period. March is the best time for pruning, but at the present time neglected bushes should be cleared of suckers and the shoots thinned moderately, leaving plenty of growths with catkins to be cut out later. All loose and exhausted soil should be cleared away from beneath the bushes, and replaced with fresh compost and manure.

THE KITCHEN GARDEN.

By EDWIN BECKETT, Gardener to the Hon. VICARY GIBBS,
Aldenham House, Hertfordshire.

A RETROSPECT.—Being the close of the year, a review of the past 12 months in the kitchen garden may be interesting. The weather can hardly be said to have been ideal; nevertheless, in very many districts vegetables succeeded remarkably well. In some cases total or partial failures were recorded, owing to the continuous rains and lack of sunshine; but on the whole it is a question whether better vegetables have ever been exhibited than those shown at the principal exhibitions in 1912. At the spring and early summer meetings of the Royal Horticultural Society excellent collections were staged, whilst magnificent produce was seen at the International Horticultural Exhibition in May. At provincial shows the vegetable classes were well contested; at Shrewsbury it was generally admitted that the vegetables surpassed those of all previous shows. Another splendid display was made at the R.H.S. special vegetable show in September, whilst the produce exhibited at the National Vegetable Society's Exhibition at Watford was the finest ever seen in this country. In the vegetable classes at the autumn shows the same high order of merit prevailed, and competition was of the keenest. Not only the quality, but the staging and packing left little to be desired. Amateurs and cottagers alike presented their exhibits of kitchen garden produce in the most attractive manner. It was my privilege on the 16th inst. to act as one of the judges at the annual Christmas show held at St. Ives, Huntingdonshire, and I was greatly impressed with the quality of the exhibits, especially those of Onions and Potatos.

Owing to the low temperatures and continued wet weather, Potato disease spread rapidly during September and October. This was especially noticeable in the case of varieties which had hitherto been regarded as more or less immune. The variety King Edward VII has not only given the best crops during the year, but the tubers have been remarkably free from disease. In other years this Potato has been affected more than any other variety, though it usually crops well. Tomatos out-of-doors have been, in most districts, a complete failure; this is the more unfortunate since the splendid results of last year encouraged growers to plant largely. Vegetable Marrows also proved very unsatisfactory, owing to the low temperatures and absence of sunshine. Peas, Beans, Cauliflowers and other Brassicas gave exceptionally good results, whilst Turnips, Celery, Carrots and Beetroots have seldom given better crops. The condition of all the winter vegetables is perfect; and unless very severe weather prevails there should be an abundance of all kinds.

PLANS FOR THE FUTURE.—During the long evenings make notes on the successes and failures of the past season. By this means mistakes which have led to bad results may be avoided in the future, and fresh methods of culture which have been found successful adopted during the coming season. Much preparatory work should be undertaken out-of-doors; the ground should be prepared carefully, seedlings tended and nursed, and autumn-sown plants, which are being wintered in cold frames, carefully watched. Roots intended for forcing should be introduced into heat as desired.

THE FLOWER GARDEN.

By J. G. WESTON, Gardener to Lady NORTHCOTE,
Eastwell Park, Kent.

PRUNING WALL PLANTS AND CLIMBERS.—Although many of the hardier climbers and wall plants retain their foliage until late in the winter, it is necessary to overhaul them thoroughly at least once a year, and, provided the weather remains open, the present is the best time for such work. Climbers should not be restricted too much in the growing season, but need only looping up at intervals during the summer; hence the necessity for a thorough pruning or thinning of the shoots at this time of year. This refers chiefly to shrubs and climbers growing on walls, pergolas, and trellises, and not so much to those in the semi-wild garden, which require somewhat different treatment. Climbers are usually planted with a view to their producing the best effect over the longest period, and for this reason a mixed collection of plants is desirable. Discretion must be exercised in the matter of pruning. Care must be taken not to remove shoots that would flower the following season. Shrubs, such as Forsythia, Chimonanthus fragrans, Jasminum nudiflorum, and early-flowering Loniceras, flower best on shoots of the previous season. These should be left for the present, and removed immediately after the flowers are over. Other wall plants, such as varieties of Ceanothus, Buddleia, Clematis, Polygonum baldschuanicum, and Solanum crispum, should be pruned well back to firm wood, retaining sufficient of the better shoots to furnish the space. Cut away all weak and unripe growth and old flowering-shoots, training the remainder thinly over the wall. Many choice evergreen shrubs, including Choisya ternata, Azara microphylla, Myrtles, Camellias, Magnolia grandiflora, Grevilleas and Olearias, do well as wall plants. These plants do not make rampant growth, and only require sufficient pruning to keep them within bounds. Besides the choicer varieties of Ivy, other good evergreen climbers are: Lapagerias, Stauntonia latifolia, and Smilax aspera. If these species are planted among deciduous subjects, they will help to give the wall a furnished appearance in winter. They require little pruning. Ivies should not be clipped for the present; this work is best left until the spring, when the plants should be trimmed closely. Fresh growth will soon cover the wall with greenery. Climbing Roses (if not already pruned as advised in my previous notes) should be well thinned, cutting out as much of the old wood as desirable: a few, well-ripened shoots present a much better effect than a large number crowded together in a limited space.

THE SHRUBBERY.—The ground between the shrubs should be cleared of rubbish and forked lightly. The fallen tree leaves should not be removed, but dug into the ground. If, for the sake of appearance, the fallen leaves were removed during the autumn, they should be replaced with a top-dressing of leaf-mould or old potting soil. The work should be done without delay, especially if bulbs are planted among the shrubs, as these are growing rapidly owing to the mild weather.

GRAVEL PATHS.—When making up gravel walks, place sufficient coarse material under the the fine gravel to ensure proper drainage, and see that the drains are in perfect working order. Since repairs to drains necessarily upset the paths, this work should be done at once, so that the gravel may be in good order again by the spring. When the paths are dry, they should be well rolled.

FRUITS UNDER GLASS.

By E. HARRISS, Gardener to Lady WANTAGE, Lockinge House, Wantage, Berkshire.

THE SEASON.—The past season has been an unfavourable one for the culture of fruits under glass. In some districts it has been a difficult matter to obtain well-ripened Grapes; our latest Grapes were not perfectly ripe until the end of October. Owing to absence of sunshine the wood of newly-planted vines has not ripened well, and much fire-heat has been required in consequence. The summer of 1912 was in direct constrast to the preceding one, and the cost of producing fruits under glass this year will have greatly exceeded the amount spent in 1911. The chief lesson which has been learnt in this connection is that of not delaying for too long the planting of late fruit trees. Late Peaches are a case in point; the almost total absence of sunshine during the later stages of their development had a prejudicial effect on the flavour of the fruits, and the young wood is not well matured. The earlier months of the season were more favourable, especially May and the greater part of April. In consequence, early fruits were excellent, but it is difficult to forecast the weather with any degree of accuracy, and it is far better to plant too early than too late.

STRAWBERRIES.—As soon as the early forced Strawberries begin to form their flower-spikes the plants should be removed to a shelf near to the roof-glass in a house having a minimum temperature of 55° or 60°. The pots are now full of roots, and some form of stimulant should be applied. Soot water, or diluted farmyard drainings, may be used during the early stages of growth. Later on, when the fruits are swelling, these manures may be supplemented by some concentrated fertiliser. During sunny weather syringe the plants with lukewarm rainwater twice daily, and keep the atmosphere moist by damping the bare surfaces in the house frequently. Further batches of plants should be introduced to heat as occasion requires. It is a good plan to put a batch in each of the different fruit-houses; but before bringing them indoors examine them carefully, and if spider is present on the leaves place the pots on their sides and syringe the foliage with an insecticide.

MELONS.—A sowing of Melons may be made at once, provided a suitable house is available. The seedlings should be raised in 2½ inch pots, filled with loam mixed with finely-crushed mortar-rubble. The pots should be plunged in a hot-bed. The seedlings should be kept near to the roof-glass until they are ready for planting out. A house or pit with a southern aspect is suitable; the structure should be cleaned thoroughly, washing every part with strong soapy water, using a stiff brush. Wash the glass both inside and out, since the plants need plenty of light. In the meantime, the materials for forming a hot-bed should be collected and prepared, so that all may be in readiness when the time for planting arrives. Stable litter and leaves in equal proportions, and well mixed, will make a suitable hot-bed. It must be made very firm, and raised quite near to the glass. The young plants may be transferred to pots, or to a bed of soil; I prefer the latter method as the plants are not so likely to receive a check, and the fruits are of better quality. The soil should be chiefly strong, fibrous loam mixed with mortar rubble and wood ashes. The mounds should be 20 inches wide and 9 inches deep; make the soil firm.

PLANTS UNDER GLASS.

By THOMAS STEVENSON, Gardener to E. MOCATTA, Esq., Woburn Place, Addlestone, Surrey.

POT ROSES.—Roses intended for early forcing may be brought into the glasshouses at once, for there is no advantage in leaving them out-of-doors after this date (except in the case of the latest batches) if room can be found for them in a quite cool house, If they have been potted and plunged as advised in an earlier calendar, the roots should have made a considerable amount of growth. They will require a week or two of rest, and dry conditions under cover, before the pruning of even the early batches is begun. After this, the plants may be accustomed gradually to slightly warmer conditions. Care must be taken, however, not to hurry them into growth unduly during the early part of the season, or they will break unevenly and produce weak, thin shoots. Tea Roses are not so popular for forcing as they were 10 or 15 years ago. They have been supplanted by such varieties as Liberty, Captain Hayward, Mrs. J. Laing, Frau Karl Druschki, Mme. Abel Chatenay, and Caroline Testout, which produce their flowers on long, stout stems that are better for use in vases than the weak, somewhat drooping stalks of the Tea-scented varieties.

HYDRANGEA HORTENSIS.—Plants which were rooted during the summer and autumn, and are growing in 4½-inch pots, should be examined. Those which are prominently in bud should be placed in a warmer house, where they will bloom early in the season. Hydrangeas last for a long period in bloom, and the flowers are varied in colour, so that the plants are particularly useful for decorative purposes. The fine new variety Mme. Emile Moullière has inflorescences of the purest white, and the plants may be had in flower through almost all the year. Other good varieties are Mdlle. Renée Gaillard (white, with serrated edge); Souv. de Mme. Chautard (large, deep-pink blossoms); Dentelle (also a white variety, which turns pink after a time); Mdlle. A. Barillette (creamy white); Radiant (deep pink, with very strong growth); Ronsard (white, changing to pink); and Botaniste Pellereau (pink, with enormous trusses and individual pips).

BOUVARDIA.—As Bouvardias cease to flower, they should be removed to a cool house, and watered very sparingly. If they still seem to be growing vigorously they may be kept in heat, and will probably continue to give a few blooms. Plants which were rooted in spring, and are flowering now for the first time, may be expected to continue in bloom. Those which have already been cut back two or three times usually flower for a shorter period.

SWEET PEAS.—Plants which were raised in September or October for flowering in pots may be transferred from the cold frame into a cool, light, airy greenhouse, first placing a few twigs round the growths to prevent them drooping. They are less likely to suffer from frost in the house than in the cold frame, and the growth will become hardier. The time for transferring them into the flowering pots (usually January or early February) will depend upon the condition of the roots. If the small pots are full of roots, the plants will suffer by being left too long in a cramped space. Rich soil is quite unnecessary in the early stages; good turfy loam, mixed with manure from a spent Mushroom bed, and a little bonemeal and wood ashes, form a suitable rooting medium. The soil should be pressed firmly. When the plants are in their flowering pots they should be allowed plenty of room. The plants should not be hurried into growth until the days begin to lengthen, and steady growth should be encouraged until the roots take firm hold of the new soil, and then, as the spring advances, a warmer atmosphere and more moisture may be afforded

THE ORCHID HOUSES.

By J. COLLIER, Gardener to Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey.

LÆLIA.—Plants of Lælia autumnalis and L. albida which have ceased to flower should be rested for a period, affording only sufficient water at the roots to keep the pseudo-bulbs fresh and plump. Damping between the pots should be discontinued, and fresh air, regulated by external conditions, should be admitted. The night temperature of the house should be about 55°. Lælia anceps and its numerous varieties are opening their blossoms, and the plants should be kept moist at the roots. After the flowering is over the plants should be given treatment similar to that recommended for the other species. The proper time for potting these Lælias is when they begin to form new roots at the base of the present season's growth.

VANDA.—Vanda Amesiana and V. Watsonii are in bloom, and, if the roots are kept moderately dry, the flowers will last for a long time in good condition. When flowering is over only sufficient water should be given to prevent the roots from shrivelling, for the plants need a brief period of rest. V. Kimballiana is no longer in flower, and should also be rested until the roots are again active, when moisture may be afforded in increased quantities.

CATTLEYA.—Plants of Cattleya Warneri, which are growing actively, should be kept in the warmest part of the Cattleya house. They should be placed in a light position, and be sufficiently watered at the roots to keep the compost moist until the flowers have opened. The work of repotting should be done immediately after the withering of the blossoms, so as to allow room for the production of fresh roots from the bases of the new pseudo-bulbs.

ODONTOGLOSSUM URO-SKINNERI.—Plants of this species will soon be pushing forth new roots from the bases of the young growths, and repotting should be attended to if necessary. The pots should be filled to half their depth with clean crocks, placing a layer of firm rhizomes over the drainage materials. The compost may consist of equal parts A1 fibre, Osmunda fibre, and Sphagnum-moss, the whole cut up rather roughly, and incorporated with crushed crocks and silver sand. The materials should be mixed well together, and the potting done lightly, so that the thick, fleshy roots may grow freely in the compost. When the repotting is complete, the pot should be filled to the level of the rim with a layer of chopped Sphagnum-moss. Very little water will be required—only just enough to keep the surface moss moist until the new pseudo-bulbs show signs of swelling, after which the supply of moisture may be increased gradually. The warmer part of the Odontoglossum house is the best position for the plants.

ONCIDIUM ORNITHORHYNCHUM. — This species has recently passed the flowering period, and as soon as the new roots are perceived to be pushing up from the base of the young growths, attention should be given them. If the plants are in pots of a suitable size, and the compost is in good condition, they need only be resurfaced. Some will require repotting, and for these a similar compost should be used to that recommended for Odontoglossum Uro-Skinneri. The plants should be grown in the cool intermediate house.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER, 41, Wellington Street, Covent Garden, W.C.**

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.*

SALES FOR THE ENSUING WEEK.

MONDAY AND WEDNESDAY—
Rose Trees, Liliums, Perennials, Shrubs. &c., at Stevens's Auction Rooms, King Street, Covent Garden, at 12.30.

WEDNESDAY—
Hardy Border Plants and Perennials, Dutch Bulbs, Lilies and other Hardy Roots and Bulbs, at 12; Special Sale of Roses, at 1; Palms and Plants at 5; at 67 and 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
Hardy Bulbs, Roots and Tubers, Herbaceous and other Plants, at 12; Roses, at 1.30; by Protheroe & Morris.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—38·5.

ACTUAL TEMPERATURES:—
LONDON.—*Sunday, December 22* (6 P.M.) Max. 50°; Min. 45°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Monday, December 23* (10 A.M.): Bar. 29·6°; Temp. 51°; *Weather*—Overcast.
PROVINCES.—*Sunday, December 22:* Max. 49° Cornwall; Min. 41° Aberdeen.

1912. Many events have conspired to make the year which is well-nigh past an annus mirabilis in the annals of horticulture. It was the year of the International Exhibition; it witnessed the formation of a horticultural branch of the Board of Agriculture; it was the first occasion on which the State gave adequate proof of its desire to aid in the development of the art and industry of agriculture and horticulture. Each of these circumstances would lend distinction to the year in which it occurred, and together they mark an epoch in horticulture. The International Exhibition gave the world a wonderful demonstration of the pre-eminence of British horticulture; and it did more than this. It proved that the artistic taste of our exhibitors has progressed with unexpected rapidity, and it showed that practical and scientific horticulturists may not be regarded as incompatibles, but are determined to work together for the further advance of horticulture. That the exhibition was successful also from the financial aspect is but a final proof of the energy and ability of Mr. Gurney Fowler and his fellow-directors, and, in bidding farewell to 1912, we may express the hope that he and they may all be spared to organize our next International Exhibition. It may be that a memorial volume of the exhibition will be published, and, if so, we hope that portraits of the "organisers of victory" will adorn its pages. We have already, it is true, a happy souvenir of the exhibition in the knighthood which was conferred on Mr. Harry Veitch, for, although the honour is his, all good horticulturists enjoy his distinction almost as though it were their own.

The exhibition has come and gone. Its fruits in gold and silver have been garnered in; but the other events to which we have referred are of too recent occurrence for us to judge what their fruits will be. Nevertheless, none may doubt that the organisation of horticulture is destined to render great service to the community. The warmth of the welcome with which Mr. Runciman's announcement was received is proof that the formation of a special branch of the Board of Agriculture has raised high hopes among horticulturists. The speed with which the President has given effect to his promise encourages this general feeling of hopefulness. Mr. Rogers has been appointed head of the new branch, and is engaged in the selection of a staff to carry out the inspection and other work of his sub-department. We understand that an expert in entomology has been appointed, and, as our readers are aware, the selection of a horticulturist to the post of general inspector will be made in the near future. Among the difficult problems which will present themselves to the Board is that of instituting an effective service for the inspection and certification of the freedom from disease of nursery stock and other horticultural produce. Markets are closing to our exporters, and nothing but a State service of inspection will satisfy foreign customers and keep foreign markets open to our traders. The present, however, is not the occasion on which to deal in detail with the work which, as we hope, lies before the horticultural branch; rather is it one in which we may all unite in congratulations that the State has at last recognised in an official manner the national importance of horticulture.

The third event which makes the past year memorable is the allocation of considerable sums from the Development Grant for the purposes of agricultural (and horticultural) education and research. In the grants which have been announced already, horticulture has not been forgotten altogether. Funds have been placed at the disposal of the College at Wye, and of the University of Bristol, for experimental work in fruit-growing. That there is ample scope for work of this nature goes without saying, and readers of our articles by *Southern Grower* are familiar with many of the questions which, in the opinion of commercial fruit-growers, are in urgent need of solution. We shall not be regarded as ungrateful if we look upon the grants which have been made for horticultural purposes rather in the light of welcome instalments than as representing a satisfaction of the just claims of horticulture. It is to be remembered that the unsolved physiological problems of horticulture are at least as numerous and important as the pathological problems. The investigation of soil sterility is making good progress at Rothamsted, but research is required into the economic importance of the new methods of forcing, the possibilities of the utilisation of electricity in plant growing, methods of ripening and storing fruit, and many other subjects. Again, beyond these problems of physiological nature lie others of economic import: problems of distribution, both of goods and of men; for instance, that concerning the keeping on the land of our own country many of the men who, if they follow custom, will emigrate to practise horticulture abroad instead of continuing its pursuit at home.

In addition to progress in the directions just described, the year of 1912 has seen an attempt to deal with the problem of horticultural education, and although the attempt has not yet led to definite results, progress has been made. The committee appointed by the Royal Horticultural Society has drafted its report, and has expressed emphatically its conclusions that a National Diploma of Horticulture should be established, and that this diploma should above all be a guarantee of its holder's skill and efficiency in practical horticulture. Should such a diploma be established, it is bound to lead to a further systematisation of horticultural education. What would appear to be urgent is the establishment—pressed for more than once in these columns—of a National Institute of Horticulture. The rôle of such an institute would be to play a part in controlling and extending horticultural education, harmonising horticultural interests, and, by differentiating between them, advancing the status of horticulturists. We can imagine no more valuable innovation than the establishment of such an institute, and we are of opinion that a national diploma issued under the joint auspices of the horticultural section of the Board of Agriculture, the Royal Horticultural Society, and the Institute, would become in a short time not only national in name but also in fact.

We pass from the review of these aspects of horticulture—upon which there is bound to be diversity of opinion side by side with community of aim—to a subject upon which there can be no two opinions. That subject is one dear to the heart and near to the lips of Englishmen—the weather. The past year will long remain notorious on account of its sunless summer. Summer came—and went before her time; in August we had to deplore the havoc of the rain, and autumn alone made some tardy amends for the meteorological misbehaviour of the earlier part of the year.

The shows of the year were remarkable for their excellence, and suffered not at all from their great competitor—the International Exhibition. Of the leading events the Holland House, Shrewsbury, Daffodil, National Rose, Sweet Pea, Carnation, and R.H.S. Fruit Exhibitions were all remarkable, and fanciers and amateurs will be pleased to know that the Daffodil Show is to be repeated, and that a Tulip Show will be held during 1913 under the auspices of the premier horticultural society.

In many ways the most interesting of the 1912 exhibitions was the first autumn show of Orchids. The fact that such an exhibition was possible at that season is a tribute to the skill and success of the hybridist, who has learned not only to combine colours, but to confound the seasons. The conference held in connection with the exhibition, though thinly attended, proved of considerable interest and value.

The exhibitions of 1913 are casting their chromatic shadows before them. Mention has been made of the Daffodil and the Tulip exhibitions, but we ought to point to the fact that there will be no "Temple" show next year. The usual May show will be held instead in the grounds of the Royal Hospital, Chelsea, which proved so fine a show site only a few months ago.

Other shadows, but grey and sad ones, have been thrown across the world of horticulture. Death has taken lavish toll, and we mourn the loss of many men of eminence in this domain of the world's work: William Baylor Hartland, the Irish nurseryman, who rescued the cottage Tulips from their rural obscurity; Alexander Dean, a great horticulturist in every sense of the word; Robert Fenn, the Potato raiser; Hayward Matthias, of Carnation fame; Pedro M. Binot, the Orchid collector; Théophile Durand, Director of the Belgian State Botanic Garden; and Eduard Strasburger, the most distinguished botanist of his generation. These men and others of no less worth have passed away.

Others have risked their lives in the service of horticulture:—G. Forrest and W. Purdon, collecting in China, suffered hairbreadth escapes, but happily have survived to supply us with new plants from the great unknown provinces on the western borders of that country.

Finally, no chronicle of the year would be complete that did not contain a reference to the wonderful popularity of the Alpine garden. There be men—and wise ones, too—who predict that "these violent delights have violent ends and of their issue die," but we incline to predict an even yet greater vogue for this style of gardening. As we admired the Alpine gardens at Chelsea, we felt or fancied something symbolic in them. They represented with consummate art a perfect blend of freedom and constraint, and symbolised the perfect state of man.

Our Almanac.—With our issue for next week we propose to publish the *Gardeners' Chronicle* Almanac for the year 1913. *In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents will send us* **IMMEDIATE INTIMATION** *of all fixtures for the coming year.*

Royal Horticultural Society.—The first meeting for the New Year will be held on January 7 in the Society's Hall, Vincent Square, Westminster. There will be no lecture on this occasion.

Bitter Pit in Apples.—Dr. Alfred J. Ewart, in a paper on "Bitter Pit and the Sensitivity of Apples to Poisons," read before the Royal Society of Victoria, gives results which show conclusively that the complaint is not due to disease, but is a symptom of local poisoning. Not only arsenate of lead, but also the other common spray poisons are effective causes of the complaint, and, so far as the evidence goes at present, bitter pit seems to be much more prevalent in sprayed orchards than in those which have never been sprayed or had any poison applied to the soil. It is shown that moderately dilute solutions of metallic poisons penetrate through the breathing pores of Apples in sufficient quantities to produce bitter pit, and yet these quantities are so minute as to be incapable of detection even by very delicate chemical analysis. Copper is not quite so poisonous as mercury, and lead much less so, while its action is also slower. Seeing that bitter pit is much more abundant in well-tended orchards than in neglected ones, it has been suggested that cultivation may be responsible by causing the roots to grow deeper than usual, and thus interfere with nutrition. This, however, is improbable, although it might be true if the subsoil contains minute traces of poison. The injurious action of copper sulphate and other soluble metallic poisons to Apples may be lessened by the addition of substances which decrease the percentage of free ions, and on these lines it may be possible to modify even such relatively insoluble spray poisons as Bordeaux mixture and arsenate of lead without appreciably affecting their value as insecticides and fungicides. It is shown that ozone, ammonia, and nitric acid present in the atmosphere are able to produce surface pitting in Apples. In conclusion, Dr. Ewart points out that bitter pit is, strictly speaking, not a disease, but a symptom of local poisoning produced in the sensitive pulp cells of Apples; that more than one poison may produce it, and that such poisons may be derived from more than one source.

Nursery Employés Social Evening.—On the evening of Friday, the 20th inst., an entertainment was given by Messrs. Dobbie & Co., Edinburgh, to the members of their staff, at the Oak Hall, Princes Street. The company numbered more than 200. The chair was taken by Mr. W. Cuthbertson, who referred in appreciative terms to the work of the staff, both at Edinburgh and at Mark's Tey. The employés at Mark's Tey were also entertained on the same evening, under the chairmanship of the manager, Mr. Andrew Ireland.

Mr. Thomas Humphreys.—The many friends of Mr. Thomas Humphreys, Curator of the Botanical Gardens, Birmingham, will learn with deep regret of the sad bereavement he has sustained in the death of his wife, which occurred on the 20th inst. from pneumonia, contracted shortly after an operation. Mrs. Humphreys was well known to exhibitors and others in the habit of visiting the Daffodil, Auricula and other shows held in the Edgbaston Conservatory, and those from a distance have frequently received from her evidences of the extraordinary kindness that was her principal characteristic. Her unexpected demise will be lamented.

Wheat Experiments.—In order to test the yielding capacities and quality of several French and certain other varieties of Wheat, the Irish Department of Agriculture carried out a series of field tests at the Albert Agricultural College Farm, Glasnevin, in 1911. The results of these tests were published in the Department's *Annual Report on Wheat Experiments* for that season. The tests have been repeated this year, and the list has been supplemented by four other varieties. Three of these were Danish Wheats imported from Copenhagen, and one a variety grown to some extent as a spring Wheat in Counties Carlow and Kildare. The yields for 1912 are, with one exception, considerably below those for 1911. The average yield of Wheat on the farm for a number of years past has been about 12 barrels per statute acre. All the French Wheats show a large decrease, and the only increased yield for the whole series is that of Red Fife, the seed of which was obtained from the produce of some hand-selected ears grown in 1910. The three Danish varieties, Queen Wilhelmina, Tystofte Small Wheat, and Danish Square Head, gave very good yields. In point of quality, Red Fife was undoubtedly the best Wheat of the series, next in order coming Burgoyne's Fife. Queen Wilhelmina, a white Wheat, may be placed next, and then, a long way behind, White Marvel. Tystofte Small Wheat and Danish Square Head are varieties of the Square Head Master type, but not so coarse. The French varieties, with the exception of White Marvel, are very poor quality, Dreadnought and Perfection being wholly unsuited for milling requirements. The partial failure of Perfection this year was, in a large measure, due to bad germination of the seed. April Red, a variety resembling Red Fife in shape of ear, excepting that it has a distinct awn, is a late spring Wheat. In yield it does not equal Red Fife, to which variety it is also inferior in quality. Regarding the two new hybrid Wheats, Little Joss and Burgoyne's Fife, while the former is undoubtedly the heavier yielder, in quality it is greatly inferior to Burgoyne's Fife. Other things, such as quality of straw, being equal, there is nothing to recommend Little Joss in preference to Tystofte Small Wheat, a variety which, by reason of its productivity and generally acceptable quality, is grown extensively in Denmark. Of all the varieties tested, Queen Wilhelmina, on account of its yielding capacity and quality, appears at present to be the most desirable Wheat, and certainly merits the attention of Irish Wheat growers.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Rhododendron ponticum var. aucubæfolium.—I enclose a small shoot of this fine winter shrub with foliage coloured bright yellow and green. The variety is sometimes known as variegatum. The plant is perfectly hardy and is free flowering. A clump of this Rhododendron is attractive all through the year, especially in winter. The leaves are not at all like those of Daphniphyllum, which is sometimes said to be one of the parents. The flowers are mauve coloured, like those of ordinary R. ponticum. *W. A. Cook, Leonardslee Gardens, Sussex.*

Flowers at Holywell, Wales.—During the past season I have noticed the following species in bloom in the neighbourhood of this old country town:—Jasminum nudiflorum, Arabis albida on walls as well as in gardens, Cerastium tomentosum, Pyrus japonica, Ribes, Viburnum Tinus (Laurustinus), Tulips, Polyanthus, Narcissus, Chionodoxa, Snowdrops, Crocus, Daffodils, Hyacinths, a bed more than a yard across of Muscari botryoides, Wallflowers in abundance on walls as well as in gardens, Violas, Auriculas, Polyanthus, Lily of the Valley, Clematis Vitalba (Traveller's Joy), Double Daisies, Deutzia gracilis, Iris hispanica, I. germanica, Pæonies, Wistaria sinensis, masses of Thrift, mossy Saxifrages, Centaurea montana, C. alba, Centranthus rubra (Valerian) on old walls and in gardens, Oriental and other Poppies, Lupins, Iberis corifolia, Lathyrus latifolius (Everlasting Pea), and Lilium candidum (at Wilton, near Ross, Herefordshire, this Lily is planted in quantity in old cottage gardens); Veronica Blue Gem, V. decussata and V. salicifolia, Delphiniums, Campanulas, Pyrethrums, Montbretias, and Campanulas Medium (Canterbury Bells). Against the end of a very old cottage I noticed a large bush of Coronilla Emerus in full flower, and Erinus alpinus on an old wall, whilst in a narrow border in a backyard the common purple and white Balsams were growing breast high. Rhus typhina, Epilobium, angustifolium, Michaelmas Daisies, and Chrysanthemums are common, and in a neglected garden were several plants of Yucca gloriosa in flower; last year I saw many plants of Yucca with inflorescences in an amateur's garden on the border of the town. Adjoining the Junction

Station platform were a dozen good plants of Kochia scoparia. Roses are not very common, but there are two or three extra good collections; the end of one house was covered with the variety William A. Richardson. Laburnums cover arches and porticoes. A strip 1 foot wide and 6 feet long in front of a cottage, apparently part of a forecourt before the pathway was paved, had mixed bulbs in spring and, later, dwarf Nasturtium and a few other annuals. All the above plants, it will be noted, were in the streets except in three or four cases. There are numbers of large Apple and Pear trees in gardens at the back of dwellings, most of them, with flat tops 15 feet to 20 feet across, and severely pruned. The larger Pear trees are of the varieties King Pear, Marie Louise, and Jargonelle. *W. P. R., Fron Haul, Holywell, November 14.*

Ripening of Wood in Fruit Trees.—Many growers contend that it is essential that the wood of fruit trees should be well ripened in order to ensure success. What difference can it make to a tree in the production of fruit whether the wood be well ripened or not? I have had 30 years' experience in fruit growing, and I cannot refrain from stating that there is absolutely nothing in this ripening of the wood theory. During the hot summer of 1911 the wood was thoroughly ripened, but the fruit crops this year were not exceptional. In the majority of gardens, I fear that they were practically a failure, especially Apples and Pears, whilst Plums were, in some, only an average crop. The reason was an insufficiency of moisture at the roots, whilst the trees were making their growth, and should have been forming fruit-buds. Experience teaches me that to be successful with fruit growing, ripe wood is not so essential as moisture both at the roots and overhead. In 19 cases out of 20 the fruit crops are better after a wet season than a dry one. Can anyone then explain why such is the case if ripening of the wood plays such an important part? If growers would pay more attention to the roots, in the way of root pruning and feeding, we should hear less of failures. Everyone is aware that large crops of fruit are obtained from trees on north walls where practically no sun can reach the wood. *L. S. Small, Malshanger Park Gardens, Basingstoke.*

Late Peas.—We gathered pods of Gradus Pea so late as the second week in December. The seeds were sown in the first week of June in heavy soil, and the crop was an excellent one. Is this a record? *Wm. G. Pallenden, Westwood Gardens, West Meon, near Petersfield.*

HAMAMELIS MOLLIS.

This handsome shrub was first figured and described by Professor D. Oliver in Hooker's *Icones Plantarum* t. 1742 (1888), from dried specimens collected in Hupeh by Dr. A. Henry; but Messrs. James Veitch & Sons had it already growing in their nurseries, raised from seed sent home from the more eastern province of Kiukiang by Mr. Maries, in 1879. Some account of this will be found in the *Gardeners' Chronicle*, xxiv (1898), p. 364, and further particulars in xxxiii (1903), p. 185. The same year a coloured figure of it appeared in the *Botanical Magazine*, t. 7,884. Hamamelis mollis is undoubtedly the most ornamental of the genus, and it may be distinguished, when in leaf, from its congeners by the dense white tomentum on the under surface of the leaves. The flowers are perhaps of a brighter yellow than those of the other species, and the seeds are white, whereas those of H. japonica are black and highly polished—at least, all that have come under my observation. If my memory serve me rightly, there are black-seeded and white-seeded species of the allied genus Corylopsis. A bush of H. mollis may be seen at Kew immediately to the right on entering by the main gates from the green. *W. B. H.*

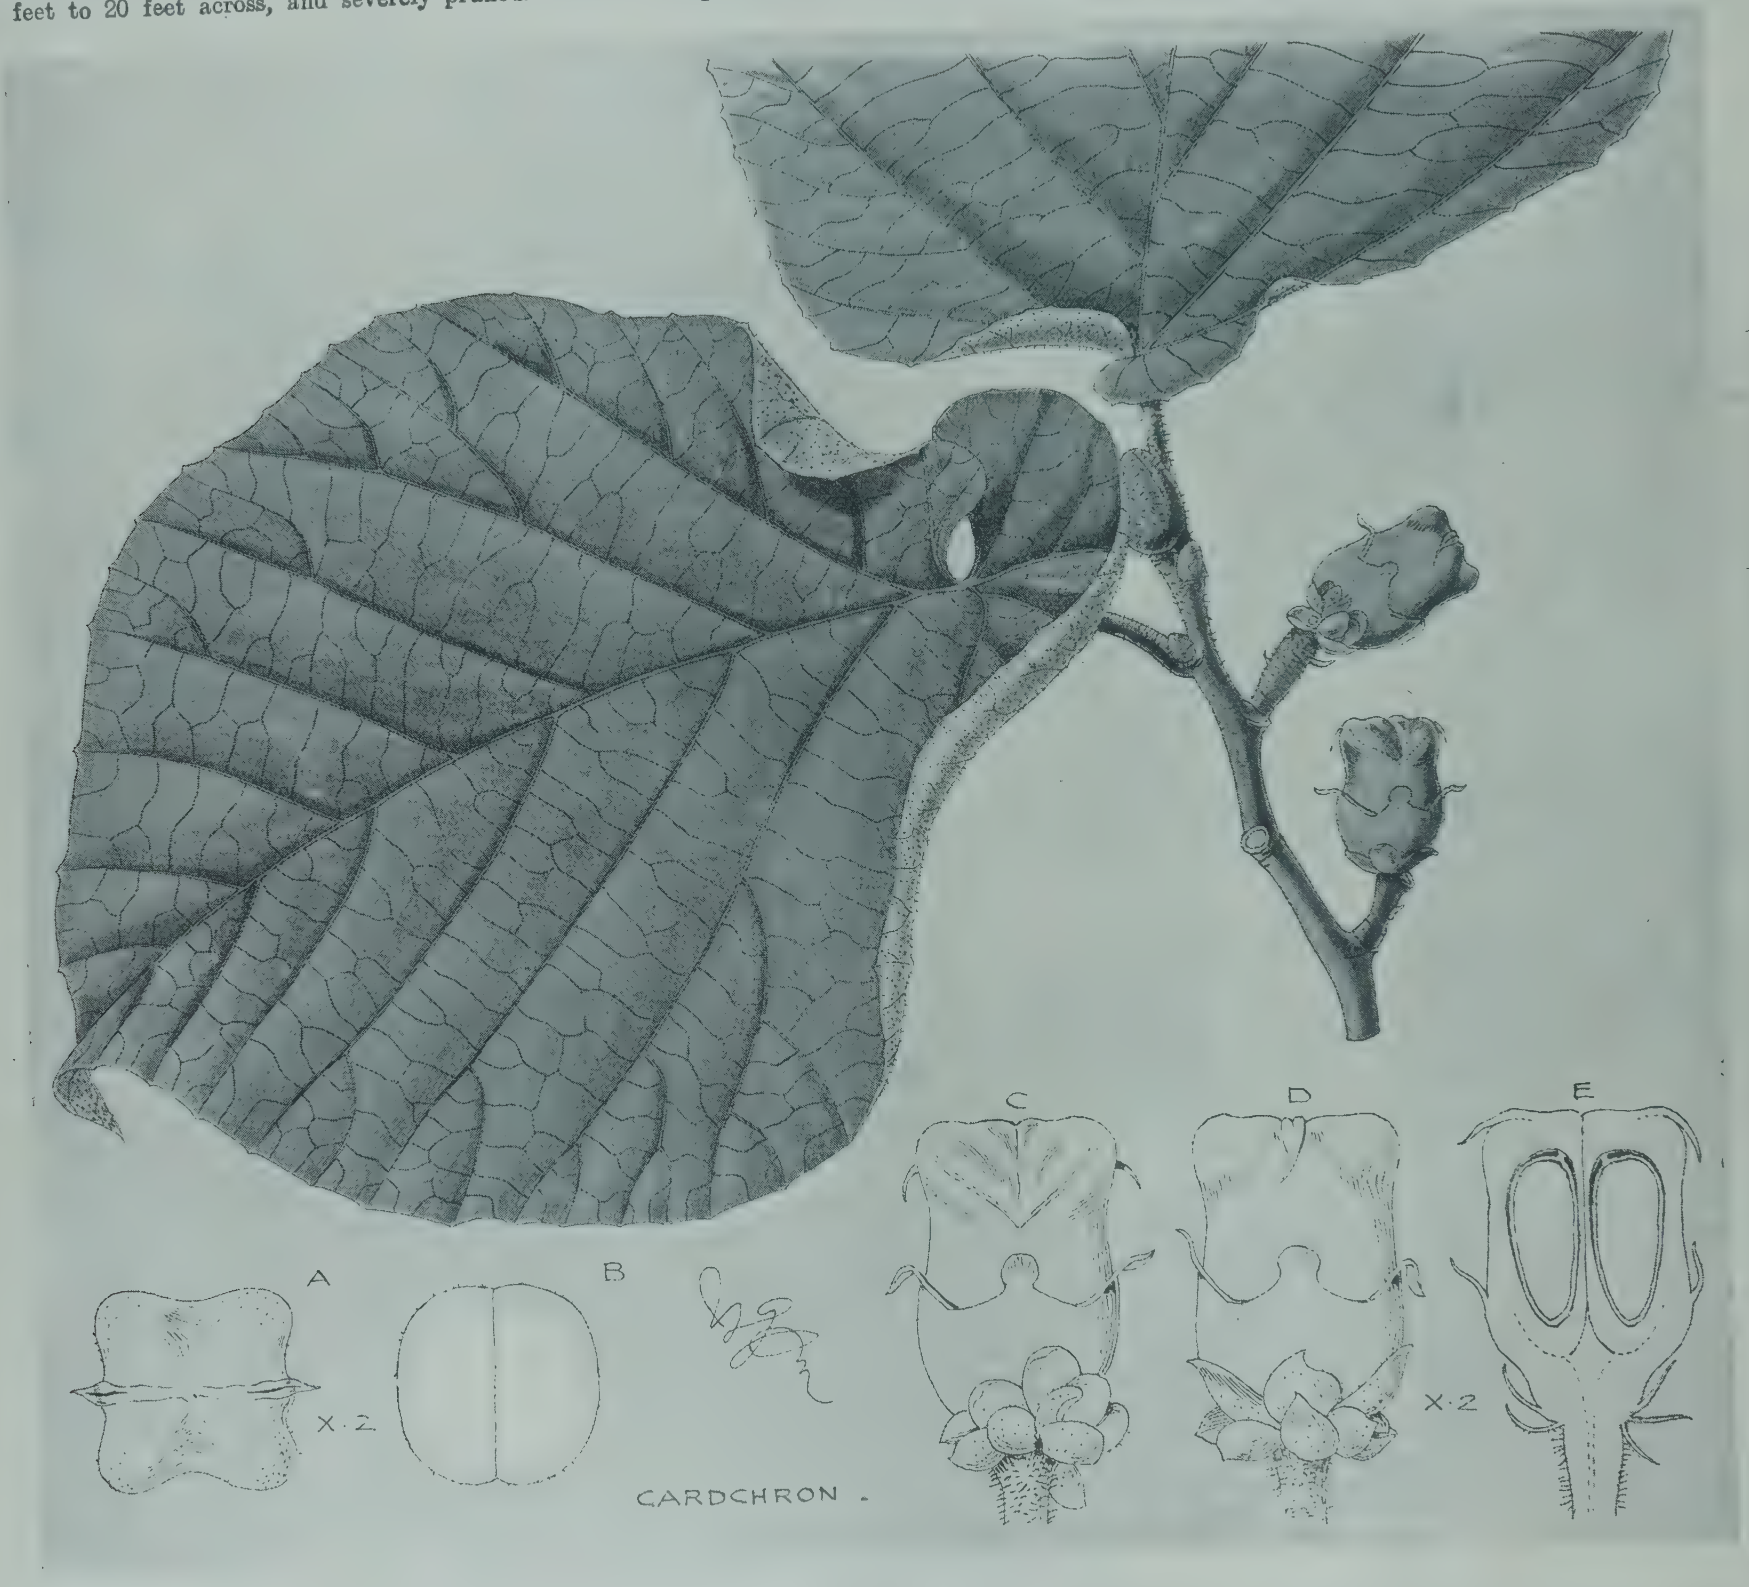

Fig. 211.—Hamamelis mollis in fruit.

A, capsule seen from above; B, cross-section of capsule; C and D, different aspects of the same; E, longitudinal section showing the attachment of the seeds of which there is one in each cell.

THE CABBAGE FLY.

A STUDY IN ECONOMIC ENTOMOLOGY.

June was near its end, and I was preparing for a little rest and change, so I went into the garden to see what there might be of interest for me to observe. As my eye passed down a row of newly-planted Cabbages, it was evident that something was amiss with at least one of the young plants. It showed signs of sickness and decline. I remembered that last year there had been a similar appearance, and that it was due to some kind of maggot at the root. On lifting the plant, I found again that there was a maggot at the root, and there could be little doubt that one of the Cabbage flies (Anthomyia radicum) was the offender. Instead of instantly consigning the creatures to the flames, I made a note of the date and of the origin and number of the maggots and placed them, with about an ounce of mould, in a cocoa tin, intending, in due course, to study their movements.

Six weeks elapsed before I took up the tin and read the note. On opening the lid to see if, after the lapse of so long a period, anything was to be learned, I found a fly fluttering away to the window, then another, and a third. The window being closed, it was possible at once to capture them and place them in a tube. Here, then, was the first observation—at the end of six weeks there were living flies. These had come from the larvæ, and, therefore, the larvæ must have pupated. But what of the other dozen or more maggots which had been placed in the box? On turning out the mould it was found that about half-a-dozen flies had emerged and died in captivity. Here was another fact, the value and interest of which will shortly appear. Empty brown chrysalis cases were found, then some which were not vacated, showing that a part of the flies had not yet emerged. No maggots remained, but the number of pupa cases, full or empty, agreed so well with my record—"about 20 grubs"—that there was no doubt all had passed into the chrysalid state.

A little further examination revealed the presence of about four different species of plant mites, three species of white worm, and a beetle larva. Some, at least, of these were evidently parasites, or, at least, retainers and followers. They could only live where the fly lived, or where the fly had prepared the way.

Now observation by itself is of but limited value. Everyone with eyes can see, and all who have ears may hear. But the question is—what do we see or hear? Only that which we bring the powers to understand. We must have, in the first place, accuracy, detail, true and full particulars; but that only supplies the groundwork. The next thing is the power to draw reliable conclusions from what has been observed. Two men observe a cloud. To one it is just a cloud and nothing more: to the other it is the precursor of a storm. The first passes on and suffers: the second makes ready for the downpour, and escapes the wetting. So two men work in the garden. Each sees his fruits and vegetables suffer. One is content with the observation: the other discovers the cause, and reasons out for himself the plan to be adopted for their future safety.

What, then, do the facts recorded respecting the Cabbage fly teach us? The lessons are many and important. Thus we find that, while some flies attack the leaf, at least one species works its mischief at the root. Where the seat of the evil is, there must the remedy be applied. If one fears that the seed-bed has been attacked, he will place the roots of his plants in some preparation which will have the effect of destroying the eggs or newly-hatched grubs. Next we have the life-history. Maggots in June, pupæ in July, flies in August. This observation is a limited and imperfect one, yet it is full of instruction. We learn that the flies do not all develop and emerge exactly in the same period or at the same time. On August 15, some flies were newly hatched, while some had died already in confinement, and others were waiting to emerge. See the meaning of this. If all took to the wing the same day, they might find the conditions adverse, and the whole brood perish. But, by emerging successively, a few at a time, they secure for their destructive race the largest possibilities, and make their offspring a perpetual source of anxiety. For it would be a poor garden and a very bad season which did not afford some of the flies an opportunity to lay their eggs. Thus we learn that constant watchfulness is necessary if the Cabbage fly is to be kept in check, and are forewarned that the moment a sickly Cabbage is observed, every grub at its root should instantly be secured and destroyed.

But even here our study does not end. When the larvæ change into pupæ, new forms of life appear. And as the flies leave their breeding-place they are attended by a number of parasitic mites, which they distribute right and left as they flit among the plants, and so carry other deadly forms of infection. While further, white worms, which need some form of decaying vegetable matter for their pabulum, haunt the place where decay has set in, and soon become so numerous as to prove a further terror to the gardener.

Apply all this to practical horticulture, and see what it means. We make a simple observation in our plot of Cabbages. Perhaps we do no more; then we leave the pest to multiply and become a constantly-increasing curse to ourselves and others. Or we go a little further and pull up the sickly specimens, and consign them to the rubbish heap. Here we have even wrought a greater evil than that of mere neglect, for we have placed the maggots in the way, perchance, of a freer and readier transformation. But if we are wise, we shall not play the priest and pass by, or the Levite and observe: we shall take the matter seriously in hand, and do our best to remedy the evil. When we can learn first to observe, then to examine, and finally draw from our observations right conclusions, we shall begin to be of service to mankind and the world. But all this means that we must have brains, and, further, that we must exercise them with patience, persistence and devotion, for thus and only thus is success to be ensured.

The lines which I have followed in this particular study are, *mutatis mutandis*, those which are to be followed generally in the study of economic entomology, and every working gardener may find at any season of the year some subject to which he may devote his attention with pleasure and profit.

For the guidance of the practical gardener and the economic entomologist, it may be well to give a few details respecting the species of Cabbage fly which we have been discussing. The imago or perfect insect is figured in Miss Ormerod's *Manual of Injurious Insects*, 2nd Ed., 1890, p. 25. The maggots are "whitish, cylindrical, and legless, tapering to the head, and blunt at the tail, and when full grown they are about the third of an inch long." In due time they change into pupæ, with brown cases, from one-fourth to one-third of an inch (or 5 to 6 mm.) in length, and 2 mm. broad. Within these cases the flies undergo their final change, and in a state of nature may emerge in about two or three weeks from the time when their cocoons are formed. The flies measure about half-an-inch in length, as well as in the spread of the wings (i.e., from tip to tip), and there is a marked difference between the male and female. The eyes are large and brown, the body dark grey, with stripes on the sides, back, and abdomen of the male. The fly is strong on the wing, and may be met with from early summer on to November. It appears that the autumn broods pupate and remain in the soil as chrysalids during the winter, ready to emerge and lay their eggs as soon as the young Cabbages are ready for them. *Hilderic Friend, Swadlincote.*

FIG. 212.—POLYGONUM CAMPANULATUM; FLOWERS PINK AND WHITE.

POLYGONUM CAMPANULATUM.

About 70 different Polygonums are found in the Himalayas, including several important garden species. One of the most valuable is the handsome P. polystachyum, which forms a bushy plant about 5 feet high, covered in the late autumn with panicles of pink and white flowers. The pretty little P. sphærostachyum grows only a foot or so high, and produces heads of rich, red flowers. It is a suitable plant for growing in moist, shady places, but P. campanulatum (see fig. 212) flourishes in the open border. The latter belongs to the same section as P. polystachyum and P. molle, two well-known garden plants, and forms a bushy plant from 2 feet to 3 feet high, with much-branched stems, terminating in cymes of pink flowers in September and October. The petioled leaves are elliptic-oval in shape, with acuminate points, the upper surface of the leaf being green, while the underside is covered with a fibrous brown tomentum. Three varieties, differing chiefly in the amount of tomentum on the underside of the leaf, are found in the temperate and sub-Alpine Himalayas of Eastern Nepal and Sikkim, at an elevation of from 9,000 to 12,000 feet. The plant illustrated in fig. 212 was received from Miss Shaen, of Binfield, who obtained seeds from Calcutta, and first flowered it in September, 1910. The species is quite hardy, and, the growth being dwarf and compact. Direct sunshine causes scorching, especially if the soil is light and dry, therefore it is best to plant it in a rather shady position. Like many other Polygonums, this species produces underground creeping stems, but not to the same extent as the Japanese P. cuspidatum; the stock may be easily increased by division of the clumps. *W. I.*

PRIMULA FORSTERI.

THE illustration in fig. 213 shows Primula Forsteri growing in a moraine in a position facing the east, where the sun's rays do not reach it. Mr. John MacWatt, of Morelands, Duns, Perthshire, who sends us the photograph, states that the situation seems to suit the plants well, as they keep in good health, grow splendidly, and flower with remarkable freedom. Mr. Farrer describes* Primula Forsteri, of the Brenner Alps, as a natural hybrid from Primula hirsuta, crossed with P. minima, and as having a closer resemblance to this latter parent. The flowers are rose-coloured.

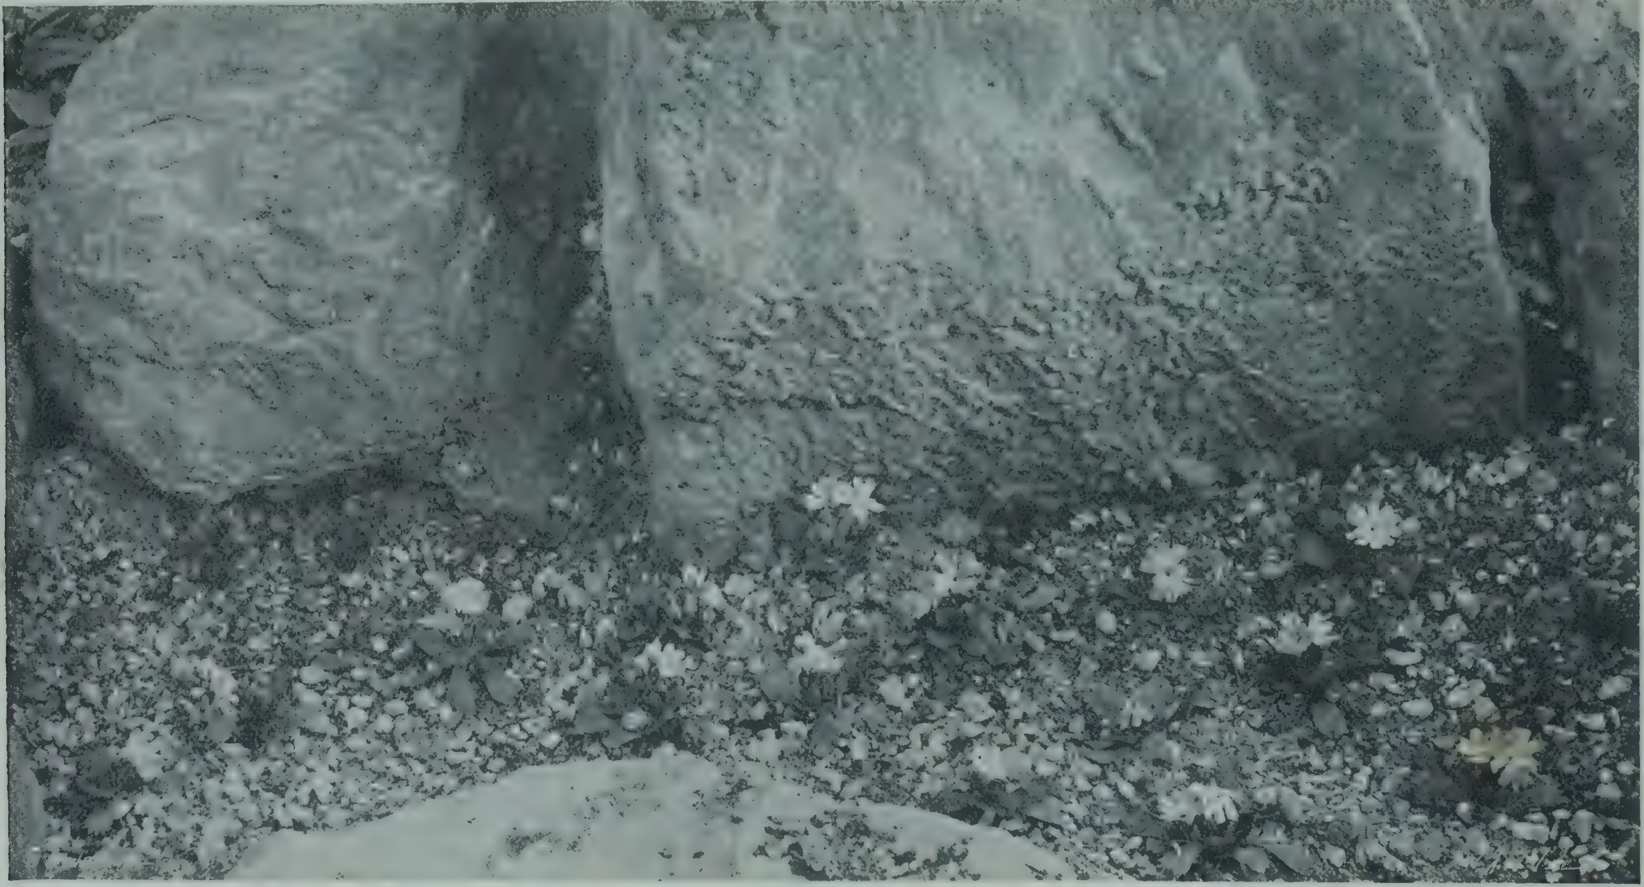

FIG. 213.—PRIMULA FORSTERI GROWING IN A MORAINE.

PROGRESS OF HUSBANDRY.

THE Presidential Address on "Early Associations for Promoting Agriculture and Improving the Improver," delivered by Mr. T. H. Middleton before the members of the Agricultural Section of the British Association last September, is full of interesting historical details, as will be seen from the following extracts. It appears that Dundee itself had much to do with the first associations for improving agriculture, for, in 1796, James Donaldson, a Forfarshire agriculturist, made a vigorous appeal for the establishment of such societies amongst farmers. Mr. Middleton states that interest in the practice of improved husbandry was first aroused in England by the books of Fitzherbert, and that it "was between 1523, when Fitzherbert's *Boke of Husbandry* was first printed, and 1557, when Tusser published his *Points of Good Husbandry*, that the classical writers began to exert a direct influence on English farming. In 1532 there appeared Xenophon's *Treatise of Householde*, 'ryht counnyngly translated out of the Greke tonge into Englyshe by Gentian Hervet,' which at once became popular and ran through a number of editions. At least as early as 1542 editions of the works on agriculture and gardening by Cato, Varro, Columella, and Palladius were published in England, and they must certainly have been known to Tusser, for in his *Five Hundred Points of Good Husbandry*, composed some years later, there is clear evidence of the influence of the writings of Xenophon and Columella.

Mr. Middleton shows that "the awakening of interest in husbandry was largely due to the rapid changes in the economic conditions of England which set in about Fitzherbert's time. These changes we cannot now discuss, but their magnitude may be indicated by the rise in price of the single staple—Wheat. According to Thorold Rogers, the average price between 1400 and 1540 was 5s. 11¾d., the decennial averages for the last four decades being 5s. 5½d., 6s. 8¾d., 7s. 6d. and 7s. 8½d. Between 1541 and 1582 the average price was 13s. 10½d., and 16s. 8d. for the last 12 years of this period. Between 1583 and 1642 the average price rose to 36s. 9d. In particular years high prices were reached, and in 1596 and 1597 Fleetwood chronicles prices of from 80s. to 104s. per quarter.

"The change in the cost of living directed men's attention to the husbandry and housewifery recommended by Fitzherbert and Tusser. The smaller landowners, who could no longer afford to live on their rents, and who saw that yeomen and tenant farmers were prospering, turned their attention to farming, and agriculture became an important occupation of the educated classes.

"The yeoman and tenant farmer did not ask for text-books on agriculture, but the new agriculturists required information, and thus there arose at the end of the 16th century a great demand for books. The booksellers were not slow to make provision for the demand, writers were secured, books were published, and of the more popular many editions were sold.

"At the end of the 16th century the practice of Continental farming began to attract attention in England, and a further proof of the demand for information which then existed was the translation in 1600 of *Maison Rustique*, a French work by two doctors of medicine, Charles Stevens and John Liebault. This volume, which in its English form is known as the *Countrie Farme*, contains seven books and 900 quarto pages. It is intended to be a complete guide for residents in the country, and deals with everything that the landowner wants to know, from the care of his health to forecasting the weather.

"The English agriculturists of the 16th century went abroad for more than books. Gerarde, who like others of his profession deserted medicine to the great advantage of botany, had obtained a number of foreign plants for his collections. From the gardener, too, England learned of the skill of the Flemings, and would gladly have copied their practice; but the Flemings were too busy to write books; so Englishmen went to see for themselves how and why they prospered.

"Sir Richard Weston, a Surrey landowner, who succeeded to his estates in 1613, and who had travelled in Brabant and Flanders, was the first English agriculturist to introduce practices approved on the Continent. He grew Turnips for feedings cows, a century before the time of Turnip Townshend; nearly 300 years ago he was experimenting, as we are still doing, with Clover seed grown in different countries; he had 30 to 40 acres of Clover sown with Barley, and he was inveighing against the sophistication of 'outlandish' grass seeds and contriving plans for raising pure stocks at home in the approved fashion of to-day.

"The importance of such crops as Clover, Lucerne, Sainfoin, and Turnips was quickly recognised, and agriculturists wished to hear and read more about the husbandry of the places from which they had come. Information was supplied in the works of the alien writers Plattes and Hartlib; the latter especially, by his *Legacie* and his *Reformed Husbandman*, did much to popularise a knowledge of Continental farming and to suggest 'the errors, defects, and inconveniences of our English husbandry.' Hartlib was a widely-travelled man, and gave our improvers many fresh ideas, among them a suggestion for a 'Colledge of Husbandry,' but we cannot claim him as an English agriculturist.

"It was not only from Brabant and Flanders that travellers brought to England information about foreign agriculture. As one result of the development of commerce voyagers were introducing from distant countries such important plants as the Potato and Tobacco, and were exciting interest by their stories of foreign products.

"In spite of the political troubles of the second quarter of the 17th century, agriculture continued to secure increased attention, for England had learned that in war or peace the food supply must be cared for, and the importance of corn growing increased with the rise in prices. Thus, when the Commonwealth was established, everything favoured a forward movement. The first practical farmer to plead the cause of the improvement of agriculture was Walter Blith, one of Cromwell's soldiers, who is supposed to have been a Yorkshire landowner, but who, for some years at least, was stationed in Ireland. Blith was himself an ardent agriculturist, and prefaced his practical book, *The English Improver Improved*, by seven epistles designed to direct the attention of all classes of his fellow-countrymen to agriculture.

---

* *The Rock Garden* (Present-day Gardening Series).

"In 1658 there was issued the first series of abstracts of agricultural experiments with which I am acquainted, under the title *Adam out of Eden*. The experiments recorded by the author, Ad. Speed, are of considerable interest; but I mention him for another reason. He appears to have made a living by propounding improvements of an imaginary character. He wrote tracts for noblemen and others, containing estimates of the profits to be gained by adopting new methods. Blith scathingly refers to him as 'Mr. Speed that superlative Improver,' and remarks that so long as his books were private 'I could bear it, and suffer wiser than myself to bee fooled because I was not wise enough as to beware of him, but now that they come to be sold in the Stationers' Shops, and spread abroad the country, to deceive, and beguile the Nation, I cannot forbear.' This was written in 1652; as my edition of *Adam out of Eden* is dated 1659, it is clear that the nation continued to be 'beguiled' for a considerable period by this particular Adam, the forerunner of a numerous family. Whenever there is a revival of interest in agriculture he flourishes; the new manure, the ravaging insect, the blighting fungus, all serve to bring 'Adam out of Eden,' and so long as an interested and gullible public exists 'that superlative Improver Mr. Speed' will be found among us. The pamphlet and the stationer's shop have become antiquated; the Adam of to-day has other methods, which I will not venture to particularise. After all, it is a healthy sign. It is only when the public thirst is deep that Adam gets his chance, and, like Blith, we must resign ourselves now and again to 'bee fooled,' for is it not one of the methods by which the Improver is improved?

"Walter Blith's appeal for the assistance of the learned did not long remain unanswered. At the time his *English Improver Improved* was published a society of scientific men had already been formed in London, and ten years later this society first received the name Royal Society, at the suggestion of John Evelyn. On October 15, 1662, Evelyn's *Discourse on Forest Trees* was presented to the Society. Five years later, when the *Sylva* was published, the author, in the preface, tells us that the Royal Society was then doing much for husbandry. Evelyn records his own experience in studying agriculture and forestry, how he had read all the old authors and got but little good from his studies, and he congratulates his countrymen that 'the *World* is now advis'd and (blessed be *God*) redeemed from that base and servile submission of our noblest *Faculties* to their blind *Traditions*.' Again, referring to the absence of a 'compleat *System of Agriculture*, which as yet seems a *desideratum*,' he says: 'It is (I assure you) what is one of the Principal *Designs* of the Royal Society; not in this Particular only, but through all the Liberal and more useful *Arts*; and for which (in the estimation of all equal *Judges*) it will merit the greatest of *Encouragements*; that so, at last, what the learned *Columella* has wittily reproach'd and complained of, as a defect in that *Age* of *his*, concerning *Agriculture* in general, and is applicable *here*, may attain its desired *Remedy* and *Consummation* in *This* of *Ours*.' He then quotes Columella's remarks about the Schools of Rhetoric, Geometry, and Music, and the absence of agricultural professors and scholars.

"John Evelyn was one of the prominent members of the Royal Society, and he seems to have taken a leading part in defending it against the attacks to which, in the first years of its existence, it was subjected. With much satisfaction he points out, in dedicating the second edition of the *Sylva* to King Charles II, that his essay and the work of the Royal Society have in the past eight years resulted in the planting of over two million timber trees.

"With the exception of the 'Societies of Learning and Gallantry' of the 'Houses of Court and Universities' addressed by Blith, the Royal Society is the earliest to which any influence on agriculture may be traced, and it is certainly the first society which definitely included the improvement of agriculture as coming within its scope. It appears to have depended public interest aroused by the writings of Evelyn and Houghton, and there is evidence that the Society gave much attention to agriculture during the second half of the 17th century, and that its patronage was much valued. The immediate influence of the Royal Society may be traced in Worlidge's *Systema Agriculturæ*.

"Evelyn's *Pomona*, in which he discourses of fruit trees and cider, gives an interesting glimpse of some of the early activities of the Royal Society, for the work itself is based chiefly on contributions by members of the Society to its '*well-furnish'd Registers, and* Cimelia.' Evelyn himself was not practically acquainted with cider-making, and his own interest in the subject, like that of the majority of his fellow-members, was Baconian—i.e., it consisted in a search for 'grounded conclusions and profitable inventions and discoveries.' Possibly, too, the badness of the French wines of the period had some share in directing the attention of the Fellows of the Royal Society to cider, for as early as January 28, 1662, they listened to a discourse on the Adulteration of Wine, by Dr. Charleton.

"In other ways the members of the Royal Society encouraged one another in making improvements; thus when in 1666 Evelyn's 'worthy friend' Mr. Hake went on a journey, he returned carrying with him—for 800 miles—some grafts for Evelyn, together with a 'taste of the most superlative perry the world certainly produces.'

"The proposal made by Worlidge was unheeded at the time, for not until nearly a century after his suggestion was made did English Agricultural Societies begin to appear. A retrograde movement set in soon after the Restoration, and although the Government sought to foster improvements and passed several Acts with the object of stimulating farming, Harte tells us that a 'total change of things, as well as the very cast and manner of thinking, joined with immoral dissipation, and a false aversion to what had been the object and care of mean despised persons, soon brought the culture of the earth into disrepute with the nobility and gentry.'

"An insight into the conditions of the last quarter of the 17th century and the first quarter of the 18th is given us by Lisle, who wrote the Introduction to his *Observations on Husbandry* in 1713. He begins by remarking that it is one of the misfortunes of the age that it lacks honourable conceptions of a country life, he draws attention to the fact that in the decadent days of Rome luxury increased and husbandry was neglected. He calls on the landowner to look around him and see how many fine estates are daily mortgaged or sold, 'and how many antient and noble families destroyed by the pernicious and almost epidemic turn to idleness and extravagance.' He discusses at length the advantages of an agricultural career and recommends it as a profession for the eldest sons of gentlemen, who might regard it as 'a school of profit and education; whereas,' he continues, 'it is rather looked on as a purgatory for the disobedient, a scene of punishment, to which a son, who answers not his father's expectations, is to be abandoned; or a condition of life of which none would make choice, but such whom fortune has not in other respects favoured. If the country gentlemen therefore frequently consist of persons who are either rusticated by their parents in anger, or who, making a virtue of necessity, settle on their estates with aversion or indifference, it is no wonder the comedians exhibit them on our stage in so despicable and ridiculous a figure; but this is the fault of the persons and not of the art. Were they properly initiated in the study of Agriculture, and pursued it as they ought, it would be so far from excluding them from useful knowledge, and bringing them into contempt, that I may venture to assert, they would find it the best school of education, and the fittest to prepare them for the service of their country in the two houses of parliament of Great Britain.'

"Such were the dispiriting social conditions with which the successors of Evelyn in the Royal Society had to contend. The agricultural experiments of the Society, therefore, attracted but little attention outside the ranks of the curious. Houghton, a contemporary of Evelyn's, started a periodical publication, *Houghton's Letters*, but it soon ceased. A generation later, and about

quotation, a work on husbandry was
a Fellow, John Mortimer. It is dea
the Society, 'to whose encouragement,
and direction it owes its birth.' Specia

culture and Gardening, a translatio
French of the Abbot de Vallemont
William Fleetwood, published anonymou
1707; this work contains the passage:
Royal Society of *England* who are so zealous for the Perfection of Agriculture and Gardening, have apply'd themselves with great Care to find out the true way to make Salt-petre, which they likewise allow to be the chief Promoter of the Vegetation of Plants.'

"About this time botanical questions of much interest to agriculturists were occupying the attention of the Royal Society. Robert Ball and Samuel Moreland were investigating reproduction in plants, and a few years later Richard Bradley, another Fellow, Professor of Botany at Cambridge, but more of an agriculturist than a botanist, was explaining how, by cross-breeding, 'such rare kinds of plants as have not yet been heard of' may be produced. He refers specifically to a cross between a Carnation and a Sweet William, but by inference to Burgoyne's Fife and the other things 'not yet heard of,' that are associated with agriculture and botany in the Cambridge of to-day.

"William and Mary were patrons of horticulture. They greatly improved the Royal Gardens, and the nobility, in imitation, laid out parks and *parterres*. This demand gave opportunity to the professional gardener, and the garden designer and nurseryman started business. It likewise gave authors their opportunity, and that it was well taken advantage of is proved by the popularity of Miller's *Gardeners' Dictionary*, written by the Gardener of the Botanic Gardens at Chelsea, and dedicated to Sir Hans Sloane, President, and to the Fellows of the Royal Society.

"A second writer on gardening of this period, the Rev. John Laurence, of Bishop Weremouth, Durham, may be mentioned, for he was also one of the chief agricultural writers of the first half of the 18th century. In 1726 he published a large folio work entitled *A New System of Agriculture*. This book marks the time when what the author calls the 'Spirit of Gardening' appeared, and it proves that gardening was very popular with the landed and educated classes for some years before the revival in agriculture began. Incidentally he refers to the condition of the North of England, and says that the county of Durham may properly be termed the Garden of the North, such are the possibilities of improvement afforded by its soil and situation and the 'hasty Diligence of a wise and polite People.'

"Although for 70 years after its formation, and throughout a period during which agriculture was neglected by the landed classes, the Royal Society did much to keep alive the Spirit of the Improver, the unfortunate apathy of the agriculturist prevented that progress which appeared to be imminent when John Evelyn wrote his *Pomona*. It was not possible for a learned society in London to investigate agricultural questions in the absence of the scientific agriculturist himself; subjects of agricultural interest were therefore discussed chiefly from a theoretical standpoint, and, neglecting the teachings of Bacon and the example of Evelyn, there arose that use of the deductive method which in the past two centuries has done so much to hinder the progress of agricultural science.

"The first to show the fallacy of the deductive method in studying this subject was Jethro Tull, who, though he himself fell into the errors which he condemned, was, in his understanding of the true relationships of science and practice, far ahead of any of his contemporaries. A lawyer by training, he probably took to agriculture because of his poor health. He worked at it for 20 years before he was induced to set out his views in writing, and it was years after he began farming before he read anything on the subject. Dissatisfied with the practice of his times, he set himself to reason out new methods and to make experiments. He got suggestions from foreign travel; he tells us, for example, that the first hint of the value of horse-hoeing

half-century are severe. He re-
ample, on the superficial knowledge
of agriculture shown by 'Mr. Laurence, a divine; Mr. Bradley, an academic; Dr. Woodward, a Physician; Mr. Houghton, an Apothecary; these for want of practice could not have the true theory; and the writers who are acquainted with the common practice, as Mr. Mortimer (whether for want of leisure, or not being qualified, I do not know), have said very little of any theory.'

"Tull himself, a thoroughly experienced, practical farmer, whose successful methods had drawn widespread attention to his Berkshire farm, showed no hesitation in setting out his own views on roots, leaves, the pasture of plants, and other scientific subjects then engaging attention. His remarks were based on original observations, and it is clear that he did not merely copy opinions from scientific treatises. He freely criticised the writings of others; even 'Mr. Boyle' and that 'miracle of a man Sir Isaac Newton' are severely handled by this critical farmer, and in a characteristic sentence he remarks: 'From Sir Isaac's transmutation arguments we may learn that a man never ought to depend entirely upon his own for support of his

meagre were Tull's opportunities for study, that he lived a retired life in the country, that he had long abandoned letters for practical farming and only began to read the works of others late in life; if, further, we remember that his health was bad, and that his appliances for scientific study were indifferent—'my microscope, indeed, is but a very ordinary one,' he writes—we must give him a foremost place among the scientific agriculturists, not only of the 18th century, but of all time. His wide knowledge and keen reasoning place his *Horse-hoeing Husbandry* in a class by itself among the works of the early improvers.

"Jethro Tull's great work was published two generations after Walter Blith first endeavoured to awaken the Spirit of the Improver in English farmers. Throughout this period not much progress had been made, but a change was at hand. When in 1730 Turnip Townshend left politics and went down to Norfolk to farm his estates, the tide had turned, and henceforward throughout the 18th century there was a rapid improvement in the practice of English agriculture."

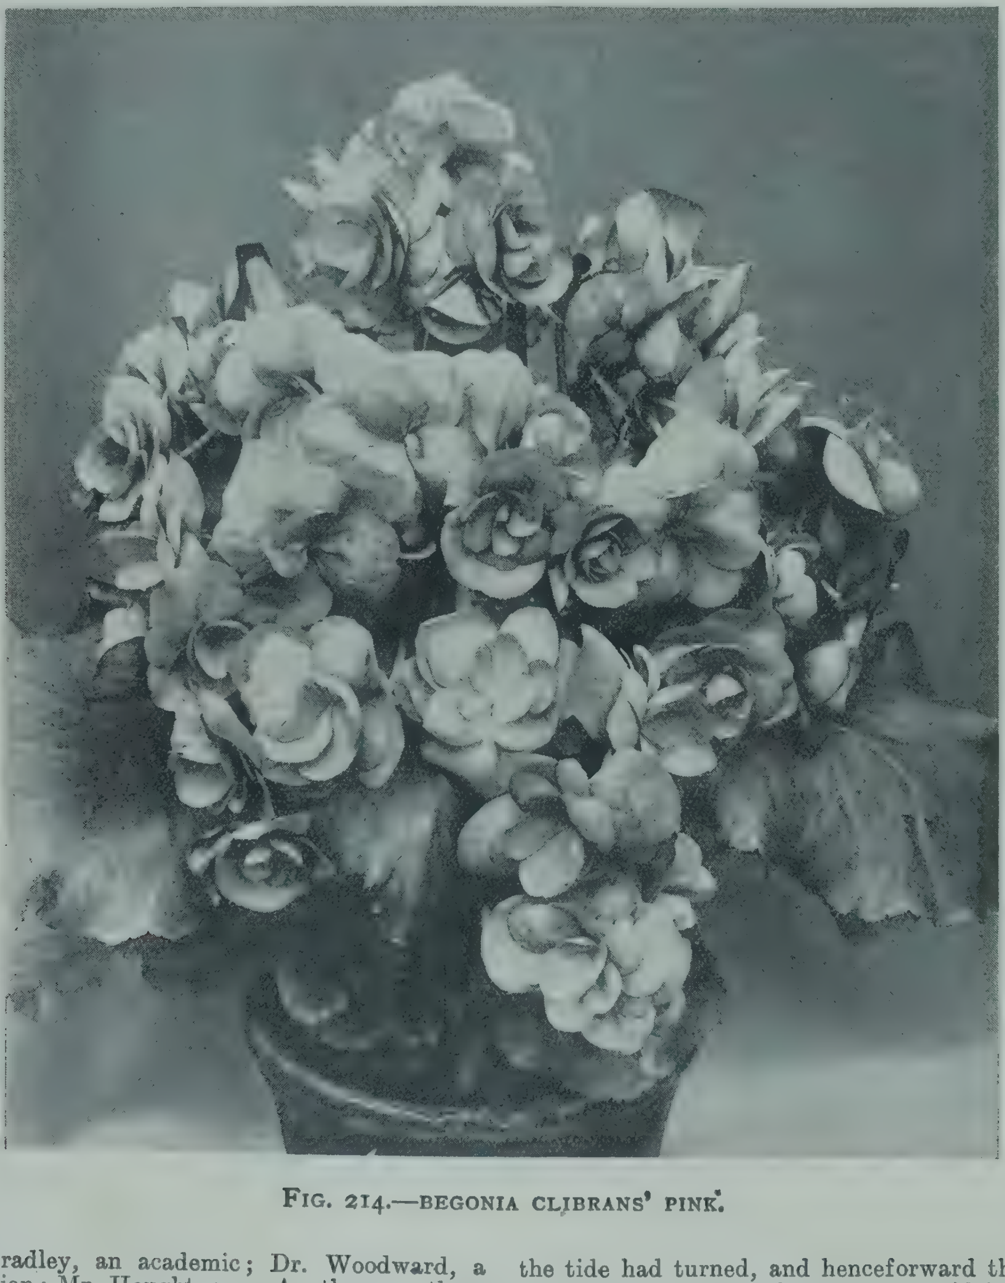

FIG. 214.—BEGONIA CLIBRANS' PINK.

BEGONIA CLIBRANS' PINK.

THE flowers of this fine winter-blooming Begonia measure 3 inches across, and are coloured bright pink; they are developed in large trusses, and there are sometimes as many as 13 blooms in a cluster. As will be seen in fig. 214 a well-grown plant resembles a posy of flowers, set off by the leaves, which are dark green in colour. Plants of this beautiful variety were exhibited by Messrs. Clibrans in a collection of these flowers at the meeting of the Royal Horticultural Society on November 19, when its superlative qualities showed to advantage amongst numerous other varieties. This variety gained an Award of Merit from the

PRUNING COMPETITION AT MADRESFIELD.

THE Agricultural Club at Madresfield Court has held a pruning competition for several years past, and there is no lessening of the enthusiasm shown both by competitors and spectators. The competition of this year was held on November 30, at the Braunford Court Farm, on the Madresfield estate. The subjects selected for pruning were Apples, Plums, Gooseberries, and Black Currants. The Apple and Plum trees ranged in age from 7 to 14 years; some were growing in Grass and some in arable land; and standards and half standard trees were included. Most of the Gooseberry and Currant bushes were full grown, so that all the plants were well established. Stewards were appointed to carry out the arrangements for the competition. They had the power to stop any pruning which they judged to be ignorant and unskilful: and this power is occasionally exercised.

The competition is usually divided into three classes—(1) for juniors, who have had no previous experience; (2) for more advanced and experienced pupils; and (3) for fully qualified pruners—the "Champion" Class. This year there were four entries in class (1), nine in (2), and six in (3). The time for each kind of tree is limited to one hour.

Black Currants were operated on first, a row of bushes being assigned to each pruner. As it is impossible to obtain several rows in which the trees are all alike in character and size, the judges take these circumstances into account when assigning the points. When the Currant bushes were finished, the Gooseberries were pruned. The competitors were watched closely during the whole time they were at work, not only by the judges and stewards, but also by visitors who take a keen interest in the contest. The Plum trees were taken next; the pruning of these trees requires care and deliberation, and the steps and saw were occasionally brought into requisition. The Apples were pruned last.

In awarding the points ten each may be given as the maximum for (1) good workmanship, (2) balance of work after the tree is finished, (3) general excellence, (4) expedition combined with good work. The marking was done by the judges during the progress of the work. Money prizes were given in each class, and a pruning knife was presented to every unsuccessful candidate.

Instruction in pruning is given to any applicant nominated by the members, by an instructor appointed by the club. The pupils are required to attend for instruction on five consecutive days, and are then permitted to qualify for competition. If they satisfy the instructor that they have profited by his instruction, they receive the sum of 12s. each.

The Madresfield Agricultural Club is probably the first to institute an annual pruning competition, though other clubs have since taken it up.

The pruning was on the whole uniformly good. This year the competitors did exceptionally well, and the mistakes were surprisingly few.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the Gardeners' Chronicle."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

MARKETS.

COVENT GARDEN, July 3.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—The final shipments of Tasmanian Apples are now being sold, the principal variety being the well-known and popular Sturmer Pippin. Loganberries are plentiful, but are meeting with a slow demand; for some reason or another they do not seem to be much appreciated by the public. Black, Red and White Currants are arriving in fairly large quantities from all sources, including the Continent. Black Currants are extra fine this season. Choice dessert Gooseberries are making their appearance in the market. Tomatos have been very plentiful, but a shortening of the supplies is expected this week-end. Cherries are a good supply, consisting of the varieties Napoleon, Waterloo, Black Eagle and Elton; all the fruits are of excellent quality. Consignments of vegetables of all kinds are sufficient for the demand. Black and Muscat Grapes are very plentiful, but the demand is limited, and their prices remain low. Peaches are a shorter supply and their prices are firmer, but Nectarines are plentiful. Consignments of both Peaches and Nectarines are arriving daily from the Continent. Figs from Worthing and the Channel Islands are plentiful, many of the samples being of excellent quality. Cantaloupe Melons are abundant; many of the fruits present a very attractive appearance. Other varieties of Melons are scarcer. Strawberries from the Southampton district are practically over, the chief sources of supplies now are Scotland (Blairgowrie) and the Home Counties. The remarks on Strawberries apply also to Raspberries. *E. H. R., Covent Garden, July 3, 1912.*

Old Potatos.

Maincrop ... ... 3 0- 3 6 per cwt.

New Potatos.

	per cwt. s.d. s.d.
Bedfords	6 0- 7 0
Kents	7 0- 8 0

	per cwt. s.d. s.d.
Blacklands ...	5 6- 6 0
Lincolns	6 0- 7 0

St. Malos ... ... 6 0- 6 3 per cwt.

REMARKS.—Supplies of old Potatos are, with the exception of a few Maincrop tubers, almost finished. New Potatos are rather scarcer on account of the wet weather, and they are selling readily at the prices quoted. *Edward J. Newborn, Covent Garden and St. Pancras, July 3, 1912.*

GARDENING APPOINTMENTS.

[Correspondents are requested to ***write the names of persons and places as legibly as possible.*** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]*

Mr. G. E. BULLEN, late Foreman for 4 years and 8 months in the gardens of Mrs. BURNS, North Mymms Park, Hatfield, Hertfordshire, as Superintendent (garden and farm) to HENRY FRASER HARRIS, Esq., Harston, Chestnut Hill, Pennsylvania, U.S.A.

Mr. W. RENNIE, for the past 12 months Gardener to Mrs. OPPENHEIMER, at Hawthorn Hill, and previously for 4 years Foreman in the Pleasure Grounds at Cliveden, as Gardener to Mrs. OPPENHEIMER, Waltham Place, Maidenhead, Berkshire.

Mr. T. CRADDUCK, Gardener to the Right Hon. LAURENCE HARDY, M.P., Sandling Park, Hythe, Kent, and previously at Hopedene Gardens, Surrey, and Eastwell Park, Kent, as Gardener to the Earl of JERSEY, Middleton Park, Oxfordshire.

Mr. A. HITCHCOX, for the past 9 months Gardener to Col. LAURIN, Orielton House, Pembroke, as Gardener to R. H. MACKWORTH-PARED, Esq., at the same place.

DEBATING SOCIETY.

BRISTOL AND DISTRICT GARDENERS'.—The monthly meeting of the above association was held at St. John's Parish Room, Clifton, on June 27. Mr. Thoday presided over a large attendance. A paper was read by Mr. Woodward on "Salads." Mr. Woodward stated that Lettuces may be had early out-of-doors by sowing in March on a warm border, pricking out the plants at a distance of 9 inches or 1 foot apart. Further sowings should be made at intervals to maintain a constant supply during summer. Chicory he advised sowing in June in rows at 1 foot apart, treating the plants as for Seakale. Endive, he said, should be grown in a sandy border, and, when large enough for bleaching, pots or boards should be placed over the rows. Radish for early use should be sown in frames or on hot beds. It is necessary to grow this crop quickly. Beetroot, Onions, Chives, Chervil, Tomatos and Cucumbers were also dealt with in the paper.

SCHEDULES RECEIVED.

Maidenhead Chrysanthemum, Fruit and Vegetable Society.—The fifteenth exhibition of Chrysanthemums, fruit and vegetables will be held in the Drill Hall, Maidenhead, on Thursday, November 7. Secretary, Mr. J. Gibson, 24, York Road, Maidenhead.

County Clare Horticultural Society.—The exhibition of flowers, fruit and vegetables of this society will be held at Ennis on July 17. The fruit and farm produce show (confined to County Clare) will be held in the Courthouse, Ennis, on October 2. The spring show in 1913 will be held at Ennis on Tuesday, April 16. Secretary, Mr. H. Bill, Lifford, Ennis, Ireland.

Freeman, Ltd., Sutton, for rustic work; Leyton Timber Co., Leyton, for rustic work; Mary Countess of Ilchester, Abbotsbury (gr. Mr. Kempshall), for cut shrubs; Messrs. Jarman & Co., Chard, for Sweet Peas, Centaureas, and Pelargoniums; and Guildford Hardy Plant Nursery, for Alpines and hardy herbaceous plants.

Bronze Flora Medals.

Bees, Ltd., Liverpool, for hardy flowers; Carlton White, New Bond Street, for Box trees; W. Fells & Sons, Hitchin, for rock plants; Misses Hopkins, Shepperton, for miscellaneous plants; Rich & Co., Bath, for hardy flowers; V. Slade, Taunton, for cut blooms and plants; Thompson & Charman, Bushey, for perennials.

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending June 29, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather* was generally cool and extremely unsettled, with frequent falls of rain in all districts. Thunderstorms were experienced in nearly all parts of the United Kingdom; at many places in the north and east they occurred almost every day.

The *temperature* was equal to the average in Scotland E., and slightly above it in England N.E. and E. In all other districts it was below the normal, the deficit being greatest in Ireland S. The highest readings were observed very generally on the 23rd, when the thermometer rose to between 70° and 75° in many parts of Great Britain and to 78° in England S.E. (at Margate). In Ireland, Scotland W., England N.W. and the English Channel it did not reach 70°. The lowest readings occurred either on the 25th or 26th, or on the 29th, the values ranging from 40° in Scotland E. and 42° in Ireland N. to 48° in England E. and S.W., and to 50° in the Channel district. At a depth of 1 foot the temperature of the soil was appreciably above the average, but at a depth of 4 feet the excess was small, and at some places in the northern parts both of England and Ireland the mean value was a trifle below the normal.

The *mean temperature of the sea* was above the average in most places, and was higher than in the corresponding week of last year. On some parts of the Scottish coasts it was, however, a trifle below the normal, and was lower than in 1911.

The *rainfall* was in excess of the average in all districts excepting Scotland N. In the western half of the United Kingdom and in England N.E. and the Midland Counties the excess was large. At Arlington, in North Devon, rain fell daily, and the total amount, 3·5 inches, was nearly four and a-half times as much as the normal for the week.

The *bright sunshine.*—In England S.E. and the English Channel the duration agreed very closely with the average, the mean daily amount in the latter district, 8·8 hours, being equal to 55 per cent. of the possible. In all other districts it was again deficient, the mean daily duration in Scotland N. and Ireland N. amounting to less than 4 hours.

THE WEATHER IN WEST HERTS.

Week ending July 3.

A cold and wet week.—The last 10 days have been more or less unseasonably cold, while the nights, on the other hand, with one exception, proved rather warm for the time of year. On the coldest day (the 2nd) the temperature in the thermometer screen did not rise above 59°, which is 10° colder than the average maximum reading at the beginning of July. The ground has been gradually getting colder, and is at the present time 1° colder at 2 feet deep, and 3° colder at 1 foot deep, than is seasonable. Rain fell on five days, and to the total depth of three-quarters of an inch. More than half of this quantity was deposited on the 2nd inst. On that day the rain began falling soon after midday, and continued, with scarcely any intermission, until 6 a.m. on the 3rd—or for 17 consecutive hours. There was no percolation at all during the week through the soil gauge on which short grass is growing, and only this morning any measurable quantity through the bare soil gauge. The sun shone on an average for 4¼ hours a day, which is 2 hours a day short of the average duration of bright sunshine at the end of June and beginning of July. Light airs and calms alone prevailed during the week. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by as much as 12 per cent.

June.

Rather wet, with an average record of temperature and sunshine.—Taken as a whole this was a month of about average temperature. There were but few warm days, and but few cold nights. On the warmest day the temperature in the thermometer screen rose to 78°, and on the coldest night the exposed thermometer fell to within one degree of the freezing point. Neither of these extremes is in any way unusual. Rain fell on as many as 17 days, and to the total depth of nearly 3 inches, which is half an inch in excess of the June average. The sun shone on an average for 6¼ hours a day, which is about the mean duration for the month. The winds were as a rule light, and in no hour did the mean velocity exceed 13 miles—direction west. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by two per cent. *E. M., Berkhamsted, July 3, 1912.*

PRIVATE.

GARDENER required for Government House, Nairobi, East Africa Protectorate, for a tour of 30 months residential service with possible extension; age between 22 and 35; preferably unmarried; strict medical examination and vaccination if necessary; salary £150 a year; quarters free of rent, but not of rates and similar outgoings, or at the discretion of the Government, and allowance in lieu of quarters; free second-class passage out and home again on satisfactory termination of engagement; half salary on voyage out; full salary from date of disembarkation on the African coast; leave on full pay after 30 months' continuous service for 2½ days in respect of each completed month of continuous service, increased to five days per month if returning to the Protectorate, with full pay during voyage or voyages and free passages. The person selected will in addition to his duties as Gardener be required to act as chauffeur; if he does not possess the necessary qualifications to enable him to do this, he will be required to undergo a course of instruction in motor car driving and repairing before he sails for the Protectorate; the cost of this will be borne by the Government. Application by letter (no special form required), stating age, whether married or single, giving full particulars of experience, accompanied by copies of testimonials (not originals), with names and addresses of referees of whom inquiries can be made as to capabilities and character, should be sent as soon as possible to the Crown Agents for the Colonies, Whitehall Gardens, London, S.W. Quote M. 5453 on left-hand top corner of application.

Borough of Margate.

THE CORPORATION require the services of a GROUNDSMAN, with experience of the care of Rubble and Grass Tennis Courts, Bowling Greens, and Cricket Pitches; applicants must be between the ages of 30 and 35 years; wages 35s. per week; particulars as to duties can be obtained on application to the Head Gardener, Dane Park, Margate; applications, stating age and experience, with copies of not more than three recent testimonials, endorsed "GROUNDSMAN," must be sent in to me not later than 1 p.m., on Wednesday, the 31st July, 1912.

EDWARD BROOKE,
Town Clerk.
Town Clerk's Office,
Margate.
1st July, 1912.

TO HEAD GARDENERS. — The Beckenham Urban District Council require the services of an experienced and thoroughly efficient GARDENER, to take charge of and assist in the laying out of their recently-acquired Kelsey Park (20 acres), to generally superintend the management of three other Recreation Grounds belonging to the Council, and to take control of Trees and Shrubs on the public highways; salary £2 per week with house and light; only applications from skilled Gardeners used to the management and laying out of large Parks or Recreation Grounds and to the control of workmen will be considered. Forms of application, &c., may be obtained from Mr. John A. Angell, Surveyor to the Council. Applications on the prescribed form, accompanied by copies of three testimonials of recent date, to be addressed to the undersigned at the Council Offices, Beckenham, and delivered before 4 p.m. on Monday, July 15th. Canvassing any member of the Council, directly or indirectly, will be a disqualification.

By Order,
F. STEVENS,
Clerk of the Council.

WANTED, GARDENER (HEAD) at once; a capable and experienced man to grow Florists' Flowers and Vegetables for Exhibition at the leading Horticultural Shows; none but those possessing special qualifications and used to this kind of work need apply.—State age, experience, wages required, and when disengaged by letter only, to "EXHIBITION GARDENER," Box 20, 41, Wellington Street, Covent Garden, W.C.

WANTED, thoroughly capable GARDENER (HEAD WORKING); accustomed to gardens very neatly kept; experienced especially with Roses, Herbaceous Plants, and Vines.—Apply, with full particulars, to Mr. IVOR VACHELL, Highmead, near Cardiff.

WANTED, GARDENER; all-round man; married, no family (or out in life); churchman; abstainer preferred; moderate wages.—M. R., Box 9, 41, Wellington Street, Covent Garden, W.C.

WANTED, GARDENER (SINGLE-HANDED, and to make himself useful); thoroughly capable with Vines, Fruit and Kitchen Gardening; must understand oil engine and electric plant; married man, not more than one in family; wife to undertake small amount of laundry; wage £1 per week; cottage, light, coal and vegetables.—Apply by letter to A. LEE, Burnside, Hatfield, Herts.

WANTED, GARDENER (UNDER); 18 to 20; single; also a Youth, about 15.—Apply to Sir JOHN PRICHARD-JONES, Elstree, Herts.

WANTED, Married Man as LEAD; Pleasure Grounds; experienced with Herbaceous and Rock Plants; age and wages, with cottage.—STEPHENS, Culham Court Gardens, Henley-on-Thames.

THE Popularity of "XL ALL" Specialities increases every year. All gardeners proclaim that nothing equals these celebrated preparations. "XL ALL" NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant, both Liquid and Cake. "XL ALL" NICOTINE INSECTICIDE WASH for Syringing, Dipping and Dressing Fruit Trees and Plants; Mealy Bug, Scale, etc., cannot exist where this is used. "XL ALL" INSECTICIDE WASH B (*sine* Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are:—"XL ALL" WEED KILLER, "XL ALL" FERTILISER, "XL ALL" ROSE MANURE. Richards' GREEN SUNSHADE, finest powder shading on the market, 1s. packet, does 100 feet of glass. Don't forget to ask your Nurseryman or Seedsman for my small pink list.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

OSMUNDA for Orchids.—Consignments arrive fortnightly. 2s. 6d. per bushel; per bag, 8s. 6d.
SANDER & SONS, St. Albans.

GISHURST COMPOUND is harmless in use; its soluble Sulphur, &c., has for 40 years cured Blights and Fungus on Plants, and is good for washing unhealthy dogs. Gishurstine keeps boots dry in all weathers; they will polish. Good for Harness.

Greenford Green, Middlesex, about ½ mile from three stations, and 2½ miles from Harrow and Ealing.

THE NURSERY, Horsenden Hill, 9¾ acres of good land and expensively constructed glasshouses, useful trade buildings; purchaser will have the option of taking large stock of Lilacs for forcing; possession on completion.

MESSRS. PROTHEROE & MORRIS will offer the above by AUCTION at the Mart, London, E.C., on FRIDAY, JULY 26th, at 2 o'Clock. Particulars of Messrs. Burgess, Cosens & Co., Solicitors, 5, Laurence Pountney Hill, E.C., or of the Auctioneers, 67 and 68, Cheapside, E.C.

Isle of Wight.

FRANCIS PITTIS & SON will SELL by AUCTION, at Warburton's Hotel, in Newport, on SATURDAY, July 27th, 1912, at 3.30 o'clock precisely, in one or three lots, the valuable FREEHOLD ESTATE known as "Langtreys," in the parish of Newchurch, comprising 35 acres of good pasture and arable land, part now in full profit as a market garden and in a high state of cultivation, planted with 2,400 fruit trees and a very large quantity of early-flowering bulbs, with dwelling house, cottage, and farm buildings.

Particulars, Plan, and Conditions of Sale of the Auctioneers, Ventnor and Newport, or of the Vendors' Solicitors, Messrs. Buckell & Drew, and Messrs. May, Woods & Pethick, Ventnor.

BUSINESSES FOR SALE, &c.

MESSRS. PROTHEROE & MORRIS, Horticultural Auctioneers, 67 and 68, Cheapside, London, E.C., will be pleased to forward particulars of either of the following properties:—

COMPACT NURSERY, situate close to seaside resort and large market city; area 3 acres; seven greenhouses and capital outbuildings; dwelling house; excellent local trade. Price on application.

COMPACT NURSERY in good district for Sale as going concern; nine greenhouses and useful buildings; capital opportunity for all-round man to do sound local business; price for everything £350.

TO BE SOLD, near Bristol, compact FREEHOLD NURSERY; area 3 acres, with 12 glasshouses, outbuildings, good dwelling house; capital trade done; price £1,600, half on mortgage if desired.

IN CHANCERY.
Messrs. H. Cannell & Son, Swanley, St. Mary Cray and Eynsford.

THESE old-established Nurseries, universally known as the "Home for Flowers," **may be acquired by private treaty as a going concern,** either as a whole or in three Lots. The properties **comprise:**

A. The Home Nurseries, Swanley, about 15 acres, with all the glasshouses, seed warehouse, office, trade buildings and residence.

B. Eynsford Nursery, part 1, 40 acres, glasshouses and residence.

B. Part 2. 229 acres of land, with a very extensive stock of young fruit trees and part also permanently planted as orchard. Farmhouse and numerous buildings.

C. St. Mary Cray, the Cockmannings Nursery, 35 acres. Conifers, ornamental trees and general nursery stock. Farmhouse and buildings.

The nurseries at Swanley and Eynsford abut to a considerable extent upon the railway, and this offers exceptional advantages for advertising the business.

The firm have been successful exhibitors at the most important shows for many years, and obtained a Gold Medal for their exhibit of Cannas, Pelargoniums, Calceolarias, &c., at the recent International Show at Chelsea.

Full particulars may be obtained from Messrs. Stone, Morris and Stone, Solicitors, 5, Finsbury Circus, E.C.; Messrs. T. P. Child & Son, C.A.s, 8, Frederick Place, Old Jewry, E.C., and Messrs. Protheroe and Morris, Auctioneers and Estate Agents, 67 and 68, Cheapside, E.C.

FIRST-CLASS, Single-handed JOBBING connection; good opportunity for active man with capital, or partnership entertained.—GARDNER, 51, Croham Road, Croydon, Surrey.

COMPACT NURSERY, 560 feet run of glass, good dwelling house, to Let, and Business to be Sold, with or without stock; good neighbourhood, suburb South London; convenient Covent Garden.—Particulars, B., Box 19, 41, Wellington Street, Covent Garden, W.C.

FOR SALE as a going concern at a valuation, an established LANDSCAPE AND FLORIST BUSINESS; quantity of Glass; well stocked; good connection in the best suburb of Leeds.—Inquiries to Mr. WM. GREEN, Seedsman, Vicar Lane, Leeds.

FOR SALE, FLORIST'S and SEED BUSINESS; cheap to immediate purchaser; good opportunity; capital wreath trade.—COOPER, Paradise Street, West Bromwich.

COMPACT LEASEHOLD NURSERY; freehold house adjoining; established 23 years by present owner who is retiring; 350 feet run glass; shop; jobbing and retail trade.—SHEAHAN, Hartfield Road Nursery, Wimbledon.

WARWICKSHIRE (Kenilworth)
(Populous District).
FREEHOLD MARKET NURSERY,

four acres of land, 24,000 square feet of glasshouses, office, stores, packing shed, boiler house, hot and cold frames, dwelling house; all modern and in first-class order.

"Gardeners' Chronicle" Offices, 41, Wellington
Covent Garden, London, W.C.

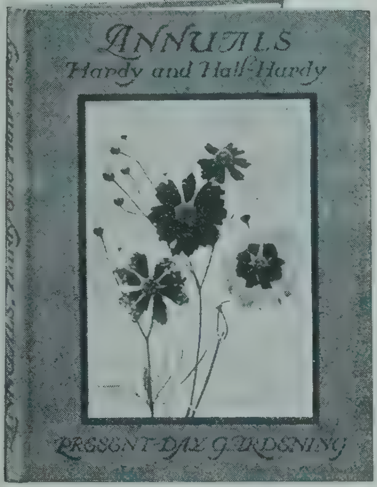
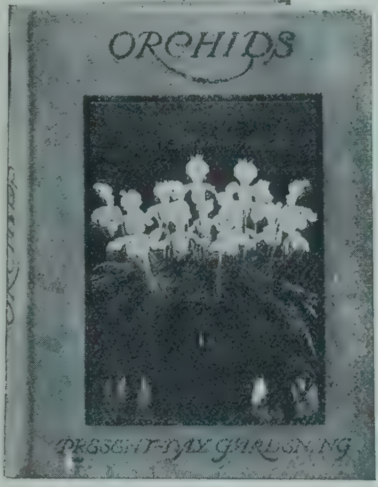
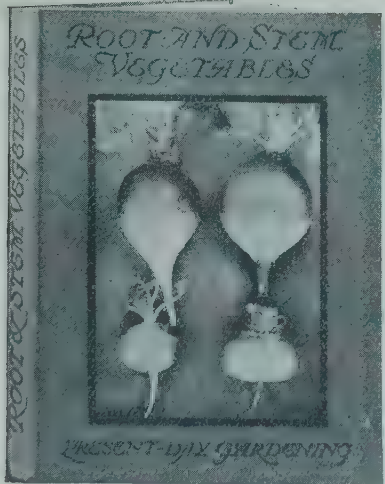
Present-Day Gardening Series







1/6 Net PER VOLUME.

Edited by R. Hooper Pearson, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. Cook, Head Gardener to Queen Alexandra at Sandringham; James Douglas, V. M. H.; and J. F. M'Leod, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By William Watson, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir Fred. W. Moore, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. Grove, F.L.S., with Preface by H. J. Elwes, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. Rickatson Dykes, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. Curtis, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. Darlington, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

Roses is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. Jacob, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. Wilks, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By William Cuthbertson, J.P., and R. Hooper Pearson.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by Thos. Stevenson.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By Alexander Dean, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By George Bunyard, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

MARKETS.

COVENT GARDEN, *July 10.*

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Remarks.—The last consignments of Tasmanian Apples have been sold this week. English Apples are now making their appearance in the market. The varieties are Julyan, Beauty of Bath, Gladstone, and Red Astrachan. Washington seedless Oranges, of fine quality, from Cape Colony are now arriving weekly, and realise high prices. Apricots, Greengages, and Plums arrive daily from Continental growers; many of the samples are of excellent quality. Grapes in the following varieties are now obtainable: Muscat of Alexandria, Canon Hall Muscat, Black Hamburgh, Alicante, Gros Colmar, Gros Maroc, and Madresfield Court. The trade for Grapes has shown a slight improvement during the past week. Home-grown Cherries are fairly plentiful. Ripe Gooseberries (black, red and white) have been arriving in sufficient quantities to meet the demands. Raspberries are, for the most part, of excellent quality; selected fruit in punnets have a ready sale. There is a limited supply of Strawberries. Peaches and Nectarines from various sources reached the market in greater quantities during the past week, and consequently their prices are lower; the principal demand has been for selected highly-coloured fruits. The supplies of Melons and Figs have exceeded the demand; large quantities of Canteloupe Melons have arrived from France and Holland. Tomatos have not been so plentiful as usual, but supplies may be expected to increase towards the end of the week, and lower prices will prevail. Loganberries have arrived in increased quantities during the week, and the demand has shown a slight improvement, but its large core makes the Loganberry unpopular with the trade and public generally. The market is well supplied with vegetables; especially Peas and Lettuces. *E. H. R., Covent Garden, July 10, 1912.*

Old Potatos.

Maincrop ... ... 3 0-3 6 per cwt.

New Potatos.

	per cwt. s.d. s.d.
Bedfords	5 0-6 0
Kents	6 0-7 0
Blacklands ...	4 6-5 0
Lincolns	5 0-6 0

St. Malos ... ... 6 0-6 3 per cwt.

Remarks.—The prices of new Potatos have fallen considerably and they promise to be cheaper still at the end of this week. Trade is very slow, which is to be expected at this time of the year. *Edward J. Newborn, Covent Garden and St. Pancras, July 9, 1912.*

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending July 6, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather*.—Early in the week the weather was extremely unsettled, with thunderstorms in a few scattered localities on Sunday, and many parts of England on Monday. After Tuesday a general improvement took place, but at the close of the week thunderstorms were experienced over a large portion of our southern and eastern counties.

The *temperature* was below the average, the deficit being slight in Scotland, but rather large (more than 3°) in England N.E. and the Midland Counties. The highest readings were recorded very generally on July 6, but in the north-east of Great Britain they occurred rather commonly on June 30. As a rule the thermometer did not rise much above 70°, but at Camden Square it reached 77° on the 6th, while at Balmoral it is reported to have reached 78° on the 5th. The lowest readings occurred at times varying greatly in different parts of the country, and ranged from 40° in Scotland E. and 41° in England N.W. to 47° in England E., and 52° in the English Channel. At a depth of 1 foot the mean temperature of the soil differed but little from the average, being slightly below it in some places and above it in others. At a depth of 4 feet it was mostly above the normal.

The *mean temperature of the sea* was above the average on most parts of our west, south and east coasts, where the water was warmer than in the corresponding week of last year. In the north and on the coasts of Devon and Cornwall it was mostly below the average.

The *rainfall*.—Over eastern, central and southern England the total amount was in excess of the average. Elsewhere there was a general deficiency and in Scotland N. and W. the deficiency was large. The largest individual fall reported was 1·3 inches at Nairn on June 30; at some places in the South and East of England considerable amounts were experienced with the thunderstorms of Saturday.

The *bright sunshine* was below the average especially over eastern, central and southern England. The daily mean amount was largest, 5·4 hours, in Scotland W. In England N.E. it did not amount to as much as 2½ hours and in the Midland Counties it was only 2 hours.

THE WEATHER IN WEST HERTS.

Week ending July 10.

The sunniest day for a fortnight.—Both the days and nights were, on the whole, rather variable in temperature. There were three warm days, and on the warmest of these (the 10th) the temperature in the thermometer screen rose to 75°. There was only one cold night, when the exposed thermometer fell to within 4° of the freezing-point. The ground is at the present time at about a seasonable temperature at 2 feet deep, and 1° warmer than the average at 1 foot deep. Small quantities of rain fell on three days; the total measurement, however, was less than one-tenth of an inch. A few drops of rainwater have come each day through the bare soil percolation gauge, but none at all through that on which short grass is growing. The sun shone on an average for 4½ hours a day, which is 1¾ hours a day short of the mean duration for the same period in July. On the one sunny day (the 9th) the sun shone brightly for nearly 11 hours. The winds have been, as a rule, light. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by 1 per cent. *E. M., Berkhamsted, July 10, 1912.*

SALES BY AUCTION.

On Wednesday Next, at 11 o'Clock.

TO NURSERYMEN, MARKET GARDENERS, SMALL HOLDING SEEKERS, and OTHERS.

In Bankruptcy re C. & F. Green. By order of the Mortgagees and Trustee.

"Fir Trees" Farm, Sholing.

Ten minutes walk from the railway station (main Portsmouth and Netley lines), comprising about 4½ acres of Nursery ground, nine glasshouses (280 feet run), a cottage residence and stabling, also a parcel of leasehold ground rents amounting to £25 per annum created on a portion of the land.

WALLER & KING will offer the above for SALE by AUCTION on the premises on July 31st, 1912. Immediately after the sale of the property the whole of the Nursery stock and plant will be sold, comprising in all over 700 lots, embracing Ferns in varieties, Bulbs of all descriptions, Chrysanthemums, Carnations, Rose trees, Tuberous Roses, Apple, Pear, Plum, Currant, and Gooseberry trees, Raspberry canes, Tomato plants, and many other fine foliage and flowering plants. The working plant includes an iron roller, harrows, horse hoe, ploughs, scales, root pulper, chaff cutter, chain harrow, carts, a trolley, flower pots, and a bay gelding; also the growing crops of Oats, Rye, Barley, and Potatos in fields close by. Particulars and catalogues can be obtained from the Auctioneers, Southampton.

BUSINESSES FOR SALE, &c.

IN CHANCERY.

Messrs. H. Cannell & Son, Swanley, St. Mary Cray and Eynsford.

THESE old-established Nurseries, universally known as the "Home for Flowers," may be acquired by private treaty as a going concern, either as a whole or in three Lots. The properties comprise:

A. The Home Nurseries, Swanley, about 15 acres, with all the glasshouses, seed warehouse, office, trade buildings and residence.

B. Eynsford Nursery, part 1. 40 acres, glasshouses and residence.

B. Part 2. 229 acres of land, with a very extensive stock of young fruit trees and part also permanently planted as orchard. Farmhouse and numerous buildings.

C. St. Mary Cray, the Cockmannings Nursery, 35 acres. Conifers, ornamental trees and general nursery stock. Farmhouse and buildings.

The nurseries at Swanley and Eynsford abut to a considerable extent upon the railway, and this offers exceptional advantages for advertising the business.

The firm have been successful exhibitors at the most important shows for many years, and obtained a Gold Medal for their exhibit of Cannas, Pelargoniums, Calceolarias, &c., at the recent International Show at Chelsea.

Full particulars may be obtained from Messrs. Stone, Morris & Stone, Solicitors, 5, Finsbury Circus, E.C.; Messrs. T. P. Child & Son, C.A.s, 8, Frederick Place, Old Jewry, E.C., and Messrs. Protheroe & Morris, Auctioneers and Estate Agents, 67 and 68, Cheapside, E.C.

FOR SALE, FLORISTS', NURSERYMANS' and SEEDMANS' BUSINESS in Bristol; good shop, dwelling-house, 400 ft. run of glass, three acres Nursery ground and outbuildings; noted floral trade; established over 20 years; rent low; sacrifice to immediate purchaser; owner offered post abroad.—Apply, PROTHEROE & MORRIS, 67 and 68, Cheapside, E.C.

COMPACT NURSERY, 560 feet run of glass, good dwelling house, to Let, and Business to be Sold as a going concern, with or without stock; good neighbourhood, suburb South London; convenient Covent Garden.—Particulars, B., Box 19, 41, Wellington Street, Covent Garden, W.C.

FOR SALE.—Genuine bargain, GREENGROCERY BUSINESS, lease and goodwill, £10; stock cost price; owner going abroad; land available.—WILLSHIRE, Ringwood.

W. A. GARAWAY, Deceased.

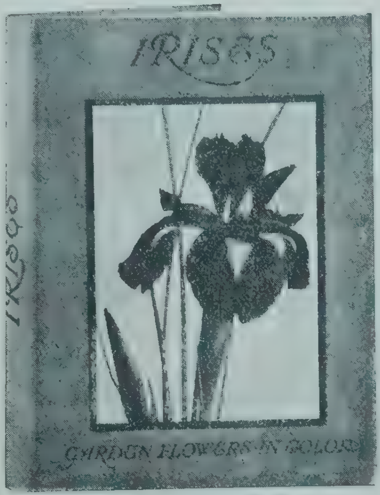
Present-Day Gardening Series



1/6 Net PER VOLUME.

Edited by R. Hooper Pearson, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. Cook, Head Gardener to Queen Alexandra at Sandringham; James Douglas, V.M.H.; and J. F. M'Leod, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By William Watson, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir Fred. W. Moore, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. Grove, F.L.S., with Preface by H. J. Elwes, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. Rickatson Dykes, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. Curtis, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. Darlington, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

Roses is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. Jacob, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. Wilks, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By William Cuthbertson, J.P., and R. Hooper Pearson.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by Thos. Stevenson.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By Alexander Dean, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By George Bunyard, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

Each Volume 1/10 post free (ROSES 2/10 & 3/10) to be obtained from The PUBLISHER, GARDENERS' CHRONICLE, 41, Wellington Street, Covent Garden, London, W.C.

THACKERAY *wrote in* 1849 *in praise of*

"PUNCH"

"THERE were never before published in this world so many volumes that contained so much cause for laughing and so little for blushing, so many jokes and so little harm."

¶ *This is no less true to-day. Why not tell your Newsagent to deliver "Punch" to you each week?*

SITUATIONS VACANT.

Four Lines 3s. (Head-line counted as Two), 6d. for each succeeding line.

PRIVATE.

Shanghai Municipal Council.

SHANGHAI POLICE FORCE.

POLICE RECRUITS are now required for the above Force; applicants must be unmarried, about 22 to 26 years of age, of good physique, with sound teeth, about 5 feet 10 inches in height, chest fully expanded about 38 inches, and able to procure excellent references as to character; salary commences at taels 70 per month, equal to about £9; there are extra allowances for knowledge of modern languages, also for plain clothes men in the detective branch; salaries rise steadily on promotion up to, in the case of Chief Inspectors, about taels 300 per month, equal to about £40; the value of the tael at present rate of exchange is about 2s. 8d., but it is liable to fluctuation. Agreement.—For three years, with free passage to Shanghai, liberal superannuation scheme, free quarters, and bonus of £5 for outfit. The climate of Shanghai is much the same as in England, though both hotter and colder; police work in Shanghai is the same kind of work as is done by any town police in the larger towns of the United Kingdom; the work in Shanghai is in no way like Colonial mounted work as done in the Colonies. Every facility is given in spare hours for enjoying all kinds of sports, such as cricket, football, cycling, &c. In addition, men of good character may take a three weeks' holiday per annum for the purposes of shooting, &c. Applicants for particulars must state their age, height, chest measurements, condition of teeth, particulars of trade or calling, and references before terms of service, and application forms will be issued to them. Apply by letter, giving these particulars, in envelope marked "POLICE," to Messrs. JOHN POOK & CO., London Agents for the Municipal Council of Shanghai, 63, Leadenhall Street, London, E.C.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the GARDENERS' CHRONICLE."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

Present-Day Gardening Series

1/6 Net PER VOLUME.

Edited by R. Hooper Pearson, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. Cook, Head Gardener to Queen Alexandra at Sandringham; James Douglas, V.M.H.; and J. F. M'Leod, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By William Watson, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir Fred. W. Moore, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. Grove, F.L.S., with Preface by H. J. Elwes, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. Rickatson Dykes, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. Curtis, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing"—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. Darlington, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

Roses is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. Jacob, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. Wilks, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By William Cuthbertson, J.P., and R. Hooper Pearson.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by Thos. Stevenson.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By Alexander Dean, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By George Bunyard, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

Each Volume 1/10 post free (ROSES 2/10 & 3/10) to be obtained from The PUBLISHER, GARDENERS' CHRONICLE, 41, Wellington Street, Covent Garden, London, W.C.

CLAY'S LONDON FERTILIZER
TRADE MARK.

Every TIN, BAG & SEAL bears this TRADE MARK—the only Guarantee of Genuineness.

"A GRAND FERTILIZER"

"The value of CLAY'S FERTILIZER needs little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. . . . The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur gardeners are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."

WEBBS' EMPEROR CABBAGE.
"BRITAIN'S GREAT CABBAGE."
Wonderfully popular, and acknowledged to be the earliest and best in cultivation. Remarkably free from any tendency to 'bolt.' 6d. and 1s. per packet; 1s. 6d. per ounce, post free.

Mr. W. STRUGNELL, Head Gardener to The Right Hon. W. H. Long, M.P., writes:—"Webbs' Emperor Cabbage has a reputation of long standing period, is dependable, early, and of good size, three distinctly good points that appeal to everyone."

WEBB & SONS, The King's Seedsmen,
WORDSLEY, STOURBRIDGE.

THE Popularity of "XL ALL" Specialities increases every year. All gardeners proclaim that nothing equals these celebrated preparations. "XL ALL" NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant, both Liquid and Cake. "XL ALL" NICOTINE INSECTICIDE WASH for Syringing, Dipping and Dressing Fruit Trees and Plants; Mealy Bug, Scale, etc., cannot exist where this is used. "XL ALL" INSECTICIDE WASH B (*sine* Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are:—"XL ALL" WEED KILLER, "XL ALL" FERTILISER, "XL ALL" ROSE MANURE. Richards' GREEN SUNSHADE, finest powder shading on the market, 1s. packet, does 100 feet of glass. Don't forget to ask your Nurseryman or Seedsman for my small pink list.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

OSMUNDA for Orchids.—Consignments arrive fortnightly. 2s. 6d. per bushel; per bag, 8s. 6d.
SANDER & SONS, St. Albans.

GISHURST COMPOUND is harmless in use; its soluble Sulphur, &c., has for 40 years cured Blights and Fungus on Plants, and is good for washing unhealthy dogs. Gishurstine keeps boots dry in all weathers; they will polish. Good for Harness.

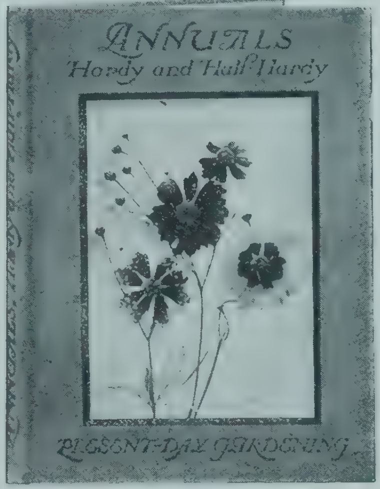
Present-Day Gardening Series



1/6 Net PER VOLUME.

Edited by R. Hooper Pearson, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. Cook, Head Gardener to Queen Alexandra at Sandringham; James Douglas, V.M.H.; and J. F. M'Leod, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By William Watson, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir Fred. W. Moore, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. Grove, F.L.S., with Preface by H. J. Elwes, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. Rickatson Dykes, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. Curtis, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. Darlington, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

Roses is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. Jacob, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. Wilks, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By William Cuthbertson, J.P., and R. Hooper Pearson.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by Thos. Stevenson.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By Alexander Dean, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By George Bunyard, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

Each Volume 1/10 post free (ROSES 2/10 & 3/10) to be obtained from The PUBLISHER, GARDENERS' CHRONICLE, 41, Wellington Street, Covent Garden, London, W.C.

MARKETS.

COVENT GARDEN, August 7.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—Heavy supplies of English Apples are arriving daily, the bulk consisting of windfalls, due to the stormy weather. With regard to Apples from Tasmania some good samples of Sturmer Pippin are still on offer. There are very heavy crops of Pears, especially such varieties as Chalks, Lammas, and Jargonelles; the fruits are cheap in consequence. There is a good sample of French fruits of Williams's Bon Chrètien. Very heavy supplies of English and Continental Plums have arrived during the past week, and are selling at very low rates. Grapes from all sources are very plentiful and sell at reasonable rates. Peaches and Nectarines have shown a considerable increase in supply during the past week, and there has been a sharp drop in prices. Supplies of both home-grown and Continental varieties of Melons are very plentiful. The market is well supplied with both English and Guernsey Figs. English and Continental Tomatos remain a heavy supply, showing a slight depreciation in prices. It is anticipated that there will be a record supply of Cobnuts this season. There is a full supply of vegetables all round. *E. H. R., Covent Garden, August 7, 1912.*

New Potatos.

	per cwt. s.d. s.d.
Bedfords	4 0- 4 3
Kents	4 0- 5 0

	per cwt. s.d. s.d.
Blacklands	3 6- 3 9
Lincolns	3 9- 4 6

REMARKS.—Trade is a little better and prices are higher. The supply is very light which no doubt is on account of the wet weather. *Edward J. Newborn, Covent Garden and St. Pancras, August 7, 1912.*

GARDENING APPOINTMENTS.

[Correspondents are requested to ***write the names of persons and places as legibly as possible.*** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]*

Mr. C. ROWLAND, who was for 9 years Gardener to Col. PALEY, Mickleton, Gloucester, as Gardener to H. C. IRVING, Esq., Burnfoot, Ecclefechan.

Mr. T. WHITE, for the past 3 years Gardener to H. M. DUNCAN, Esq., Fairlawn, Weybridge, as Gardener to EDWARD J. PREVITE, Esq., Foxhill House, Keston, Kent.

Mr. F. J. HAYLER, late of Dunsland, Glanmire, Co. Cork, as Gardener to Capt. TYNTE, Tynte Park, Co. Wicklow.

Mr. J. F. LEWIS, for the past 3½ years Gardener to WILLIAM ROBINSON, Esq., Gravetye Manor, East Grinstead, Sussex, as Gardener to A. HUGH HARMAN, Esq., Grayswood Place, Haslemere, Surrey.

Mr. A. J. DOWDING, for 5 years Second Gardener at The Oaks, Chester, as Gardener to ROBERT E. STEPHENS, Esq., Kelston Knoll, Weston, Bath.

Mr. W. E. JONES, for 4 years Gardener to ALFRED A. THORN, Esq., Harcourt, Linslade, as Gardener to W. GRAVELLY W. WILLIS, Esq., North Street, Leighton Buzzard.

Mr. F. J. HUNT, for the past 2 years Foreman in the gardens, Oakley Hall, Basingstoke, and previously at Pinkney Park, Wiltshire, as Gardener to the Rev. ARTHUR NAPIER, Kingston Rectory, Wareham, Dorsetshire. (Thanks for 2s. for R.G.O.F. box.—EDS.)

DEBATING SOCIETY.

BATH GARDENERS'.—The annual outing of the members of this society took place on Wednesday, July 24. A party of about sixty assembled at 8 a.m., and drove by motor to Wilton House, Salisbury, the home of the Earl of Pembroke and Montgomery. The visitors were conducted through the beautiful gardens and pleasure grounds by the gardener, Mr. Thomas Challis.

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending August 3, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather* was extremely unsettled throughout the entire week. Rain was frequent and often heavy, the sky seldom clear, and thunderstorms occurred on at least one occasion in most districts. At Alnwick Castle on July 29 a thunderstorm was accompanied by very large hail.

The *temperature* was much below the average; in Ireland S. the deficit was nearly 6°, and in many other districts more than 4°. The highest of the maxima were generally recorded early in the week, and ranged from 70° in England N.E., E. and S.E. to 64° in several districts in the extreme north-west and north. The lowest of the minima, which occurred at most stations on August 3, were very low for the time of year. In England S.W. (at Llangammarch Wells) the thermometer fell to 30°, and Scotland E. (at West Linton) to 31°, while elsewhere the readings ranged from 34° in England S.E. and N.W. to 39° in Ireland N., and to 46° in the English Channel. On the grass the lowest values were 25° at Birmingham, 28° at Llangammarch Wells and Crathes, and 30° at Hereford and West Linton. At all stations except Clacton-on-Sea the thermometer at 1 foot below the surface of the soil recorded readings below the normal, but at 4 feet the mean values were mostly above the average.

The *rainfall* was more than the average, the excess being very large except in Scotland and England E. Falls of more than an inch in 24 hours occurred on July 28 and 31 and August 1 and 3. On the 31st ult. they were very general in the north-west of England, and on the 3rd inst. in the south-west. The heaviest daily amounts were 1·9 inch at Malin Head on the 28th ult., 2·3 inches at Blackpool on the 31st inst., and 1·9 inch at Scilly and Falmouth on the 3rd inst.

The *bright sunshine* was considerably below the normal. Over a large area in the north and north-west of the Kingdom the mean daily amount was less than 3 hours, and in all districts excepting the English Channel it was less than 4½ hours. The percentage of the possible duration ranged from 16 in Scotland N. and E. and 18 in England N.E. to 29 in England E. and S.E., and Ireland S., and to 39 in the English Channel.

THE WEATHER IN WEST HERTS.

Week ending August 7.

Exceptionally cold, wet and gloomy.—Throughout the past week the days have been all, more or less, cold for the time of year, while there has occurred only one unseasonably warm night. On the coldest day (the 6th) the temperature in the thermometer screen never rose higher than 59°, which is about 11° colder than is usual at the beginning of August. On two consecutive nights the exposed thermometer fell respectively to within 5° and 1° of the freezing-point, the latter being the lowest reading recorded here in the month of August since 1892, or for 20 years. At 2 feet deep the ground is now 3° colder, and at 1 foot deep 4° colder than is seasonable. Rain fell on five days, and to the total depth of more than 1½ inch, making this the wettest week since the third week in January, or for over six months. These rains have re-started the percolation gauge on which short grass is growing, through which no rainwater at all had previously passed since the middle of June, or for seven weeks. About 2½ gallons have come through the bare soil gauge during the week. The sun shone on an average for only four hours a day, which is 2½ hours a day short of the usual duration for the first week in August. The winds were again, as a rule, rather high, but in no hour did the mean velocity exceed 13 miles. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by 9 per cent.

July.

Seasonable in temperature and rainfall, but unusually calm and gloomy.—Taken as a whole this proved a July of about seasonable warmth. There occurred a hot period in the middle of the month lasting eight days, on five of which the highest temperature in the thermometer screen exceeded 80°. On the hottest of those days the highest reading was 87°, making this with three exceptions the hottest day I have yet recorded here in July. On the coldest night the exposed thermometer fell to 36°, which is about the average extreme minimum reading for the month. Rain fell on 16 days, and to the total depth of 2½ inches, or slightly less than the July mean. The sun shone on an average for 4¾ hours a day, which is 1¾ hours a day below the usual duration for the month. During the past 22 years there has occurred only one other July as sunless. The winds proved unusually light, indeed, with one exception lighter than in any of the previous 26 Julys. In no hour did the mean velocity exceed 13 miles—direction west. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by eight per cent. *E. M., Berkhamsted, August 7, 1912.*

Roses. By Gemen and Bourg

CABBAGE PLANTS.—Ellam's Early, nice plants, 6d. 100, 2s. 500, 3s. 1,000.—W. HORNE & SONS, Cliffe, Rochester.

SURPLUS MALMAISON PLANTS in 5-inch, 20 varieties, grand bushy stuff; cheap to clear list.—E. HALL, Bowden, Chippenham.

WALLFLOWERS.—Vulcan, Blood Red, and Golden King, 1s. 6d. 100, 10s. 1,000; Forget-me-Nots, 2s. 100; Coreopsis grandiflora and Gaillardia grandiflora, 9d. per dozen, 5s. 100; Canterbury Bells, extra strong stuff, 3s. 100; Iceland Poppies, orange, white, yellow, 2s. 100; Hollyhocks, finest double, 2s. and 3s. dozen; catalogues on application.—BROADHEAD'S, Wooldale Nurseries, Thongsbridge, Huddersfield.

100,000 WALLFLOWERS, Blood Red and Cranford Beauty (yellow); Seed direct from Carter's; grand plants.—FELGATE & SONS, Burhill Nursery, Walton-on-Thames.

ORCHIDS, 75, in good condition; big variety; amateur collection; large plants; cost £25; accept £6 immediate sale.—19, Larkfield Road, Richmond, Surrey.

GOLDEN PRINCEPS NARCISSUS, very fine large bulbs, ready for boxes or pots for Christmas flowering, price 10s. per 1,000, 3,000 for 28s.; carriage paid for cash; 50,000 to sell.—J. HANDSCOMBE, F.R.H.S., The Nurseries, Feltham, Middlesex.

MISCELLANEOUS.

SPHAGNUM-MOSS, fresh, clean, 5s. bag; Peat, good brown, six bags, 9s.; 10 yards in truck, 70s.; Fibrous Loam, 10 yards in truck, 80s.; Bonemeal, 8s. cwt.; Charcoal, best, 7s. 6d. per cwt.—ALBERT HEAD, Seaford Road, Wokingham.

SEVERAL thousand feet 4-inch Hot-water Piping, joints and bends, 4d. foot as they lie; also number glasshouses, various sizes, equally cheap.—HEATH & SON, Cheltenham.

FOR SALE.—What offers for eight volumes Nicholson's "Dictionary of Gardening"; cost £3 8s. new.—A. W. PRENTICE, Witham, Essex.

BOILER (12 to 18 hours) and PIPES (Greenhouse), about 70 ft. 4 in. by 30 ft. 2 in., screw valves, H piece with valves, bends, reducers, ball cistern, rubber joints, complete, cost £14, accept £6 or near offer.—19, Larkfield Road, Richmond, Surrey.

PEAT! PEAT! PEAT!—In consequence of a death and the estate being sold, three acres of the finest Peat has to be cleared. The price of the same, suitable for Orchids, is 10s. 6d. per cubic yard, 3s. 6d. per sample sack; the remainder, a good general Peat, at 7s. 6d. per yard, not less than six yard truck loads in any case, or the latter, in well-filled bags, six at 2s. 6d. each. I have made arrangements with the railways for a special cheap rate for same.—Apply to Sole Agent, GEO. B. DENNIS, Esq., Hanworth, Middlesex.

PEAT, FIBRE.—Having a large order for Orchid Peat, I have over 150 yards left on my hands taken from it, and am offering it at a low price to clear; in bags or truck loads at 40s. and 80s. per truck of 6 and 12 yards each. LOOSE PEAT, suitable for covering, &c.; the same character as Cocoanut Fibre and same colour, suitable for bulb beds, covering pots and boxes, and can be used afterwards to pot up spring cuttings, &c.; price 2s. per bag of three bushels; carriage paid on six bags 20 miles for 5s. extra. Sample sent willingly for three stamps. I have only 150 cubic yards to sell; a bargain.—Apply to J. HANDSCOMBE, F.R.H.S., Wholesale Peat and Fibre Works, Feltham, Middlesex. Established 33 years.

Kirengeshoma palmata,

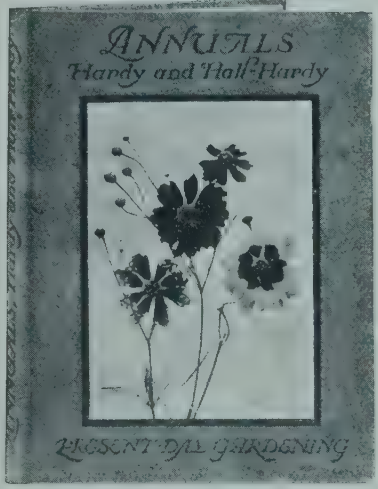
In consequence of the increase in the circulation, and also of the earlier despatch of the morning trains from London, the hour of going t press has been again advanced, and in futur Advertisements received after 5 p.m. o WEDNESDAY will be held over till th following week. On no consideration what ever will any exception be made to this rule

Present-Day Gardening Series



1/6 Net PER VOLUME.

Edited by R. Hooper Pearson, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. Cook, Head Gardener to Queen Alexandra at Sandringham; James Douglas, V.M.H.; and J. F. M'Leod, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By William Watson, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir Fred. W. Moore, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. Grove, F.L.S., with Preface by H. J. Elwes, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. Rickatson Dykes, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. Curtis, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. Darlington, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

Roses is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. Jacob, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. Wilks, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By William Cuthbertson, J.P., and R. Hooper Pearson.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by Thos. Stevenson.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By Alexander Dean, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By George Bunyard, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

Each Volume 1/10 post free (ROSES 2/10 & 3/10) to be obtained from The PUBLISHER, GARDENERS' CHRONICLE, 41, Wellington Street, Covent Garden, London, W.C.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the Gardeners' Chronicle."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

Kelway's Delphiniums
are better than ever.

There is no finality to their improvement.

NINE varieties certificated by the Royal Horticultural and two by other Societies, **this season (1912)**, were **raised** and **introduced** by Kelway & Son. This fact constitutes a veritable triumph in horticulture.

With one exception, practically all the well-known good Delphiniums (King of Delphiniums, Persimmon, True Blue, Beauty of Langport, Mrs. Creighton, Ustane, Duke of Connaught, etc., etc., etc.) originated in Kelway's Langport Nurseries.

SEVENTY First Class Certificates or Awards of Merit have now been given to varieties of Delphiniums of Kelway's raising, and very many Gold, Silver Gilt and Silver Medals, chiefly by the R.H.S., and also by provincial and international Societies, to their exhibits of lovely new varieties.

Our varieties, Lovely, Dusky Monarch, Dr. Lodw'dge, Smoke of War, Mrs. Jas. Kelway, Star of Langport, etc., certificated this year, and Ladye Faire, Christine Kelway, Countess of Ilchester, Masterpiece, Prima Donna, James William Kelway and others of last and previous year are real marvels, whilst we have many absolute **WONDERS** still to come.

Most of the above and similar fine kinds will be booked at **10/-** each; or collection E (recommended) at **£3** per dozen. Also quotations made for any quantity of cheaper kinds for beds of a colour, or for massing for effect.

Please write at once and particulars will be sent now or at planting season.

CLAY'S LONDON FERTILIZER

TRADE MARK.

Every TIN, BAG & SEAL bears this TRADE MARK—the only Guarantee of Genuineness.

"A GRAND FERTILIZER"

"The value of CLAY'S FERTILIZER needs little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. . . . The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur gardeners are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."

NURSERYMAN AND SEEDSMAN, 20th July, 1912.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the GARDENERS' CHRONICLE."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

MARKETS.

COVENT GARDEN, *August 21.*

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Remarks.—Home-grown dessert and culinary Apples from all sources are very plentiful, supplies being much in excess of demand. Crops of Pears—Hazel, Jargonelle, Clapp's Favorite, and Williams's Bon Chrétien—are very heavy. French Pears are also being largely supplied. Large consignments of Californian Pears will shortly be received. Plums—Greengages and Damsons—are coming in good quantities; also French and Spanish Plums. Peaches and Nectarines are plentiful; a few selected fruits are much in request. Melons and Figs are still being fully supplied and are meeting with a rather slow demand. Nuts—Filberts and Cobs—are arriving principally from Kent, and there is a very heavy crop of every kind. Cultivated Blackberries are now making their appearance in chips (4lbs.). Mushrooms (outdoor) are obtainable in large quantities; the cultivated kinds being supplied in amounts about equal to the demand, but sold somewhat cheaper in consequence of large arrivals of the outdoor kinds. Grapes are still arriving in large quantities from all sources. Tomatos have shown a considerable increase in supply since last week. The Vegetable Market has been well supplied, clearances being effected at very low rates. *E. H. R., Covent Garden, August 21, 1912.*

Remarks.—Trade is still very quiet, and there is a fair supply considering the state of the weather. The blight throughout Lincolnshire and Cambridgeshire is quite as serious as reported. *Edward J. Newborn, Covent Garden and St. Pancras, August 21, 1912.*

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending August 17, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather.*—The conditions were unseasonable in all parts of the kingdom, but the rain was less heavy generally than during the preceding week. In some localities in the north-east of England more than half the days were rainless. Thunderstorms occurred in various parts of eastern England during the earlier half of the period. At Southport, on the morning of the 13th, three striking waterspouts were observed: two over the Ribble Estuary and one over Liverpool Bay,

The *temperature* continued below the average, the deficit amounting to about 6° in England S.E. and the Midland Counties to 5° in England E. and S.W., and to 4° in Ireland. In Scotland N. and W. it was only 2°. The highest of the maxima were registered at most stations on the 16th or 17th, and ranged from 71° in England N.E. to 65° in England S.W., Ireland N., and Scotland N. The lowest of the minima, which occurred generally about the middle of the week, ranged from 34° in Ireland N. 35° in England S.W., and 36° in the Midland Counties, to 41° in Scotland N., and to 49° in the English Channel. The lowest grass readings reported were 27° at Raunds and Birmingham, 30° at Dublin, 31° at Markree Castle, Llangammarch Wells, and Hampstead, and 32° at Hereford. The temperature of the soil was below the average in all parts of the kingdom, both at the 1 foot and 4 feet, the divergence at 1 foot being large.

The *rainfall* exceeded the normal in England S.E., S.W., and N.W., and also in the English Channel, but was less in the other districts. As much as 2·2 inches fell at Jersey on the 12th, and 1·1 inch at Plymouth and Salcombe on the 17th.

The *bright sunshine* was again much below the average. In most districts the mean daily duration was less than 2½ hours, and in the Midland Counties, England S.W, and Scotland N. and E. less than 2 hours. The percentage of the possible duration ranged from 21 in the English Channel and Ireland N. to 11 in Scotland N. and the Midland Counties, and to 9 in Scotland E.

THE WEATHER IN WEST HERTS.

Week ending August 21.

The third cold and gloomy week in succession.—Throughout the past week the days have again been unseasonably cold, while the nights were, as a rule, rather warmer than the average. On the warmest day the temperature in the thermometer screen never rose above 65°, but on the other hand on no night did the exposed thermometer register a reading below 40°. At 2 feet deep the ground is now 3°, and at 1 foot deep 4°, colder than is seasonable. Rain fell on each day of the week, and to the total depth of more than three-quarters of an inch. Since the present month began rain has fallen on all but four days, the total measurement amounting to 2½ inches, or about the average quantity for the whole of the month. During the week 1½ gallon of rainwater has passed through the percolation gauge on which short grass is growing, and 1½ gallon through the bare soil gauge. The sun shone on an average for only 1½ hour a day, which is as much as 4½ hours a day short of the usual duration in the middle of August. The winds proved, as a rule, rather high, but in no hour did the mean velocity exceed 11 miles. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 16 per cent. *E. M., Berkhamsted, August 21, 1912.*

GARDENING APPOINTMENTS.

Mr. W. Cooper, for the past 12 years Gardener at Chadacre Hall, Bury St. Edmunds, as Gardener to Mrs. Pearson, Millfield, Great Berkhamsted.

Mr. F. Whicker, for 5½ years Gardener to Col. Kemmis, C.M.G., Everton Grange, Lymington, Hampshire, as Gardener to Ivor Vachell, Esq., High Mead, near Cardiff. (Thanks for donation of 2s. 6d. for R.G.O.F. box.—Eds.)

Mr. J. Downham, for the past 5 years Gardener to J. W. C. Frere, Esq., Southfield House, Wimbledon Park, as Gardener to H. Bull, Esq., Wells Bridge House, Ascot, Berkshire. (Thanks for donation to the R.G.O.F. box.—Eds.)

DEBATING SOCIETIES.

BATH GARDENERS'.—The usual monthly meeting of this society was held at the Foresters Hall, Bath, on the 13th inst. Mr. T. Parratt, chairman, presided over a good attendance of the members. A lecture on "Vegetable Cultivation" was given by Mr. C. J. Wait.

STIRLING AND DISTRICT HORTICULTURAL.—The last excursion for the season of the members of this society took place on the 10th inst., when Dalmeny Park, the seat of Lord Rosebery, was visited. The nursery for the rearing of forest trees, coniferæ, and shrubs; the home-farm, the gardens and policies, and Barnbougle Castle were all inspected. Tea was provided by the factor, Mr. McLaren, who was formerly a member of the association.

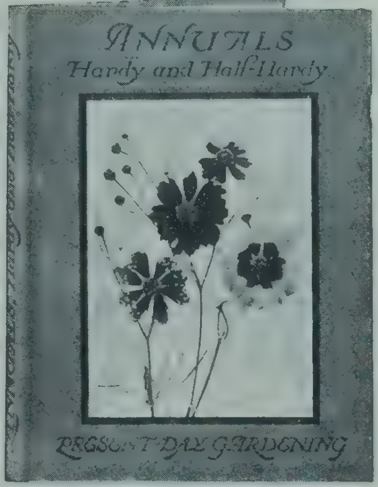
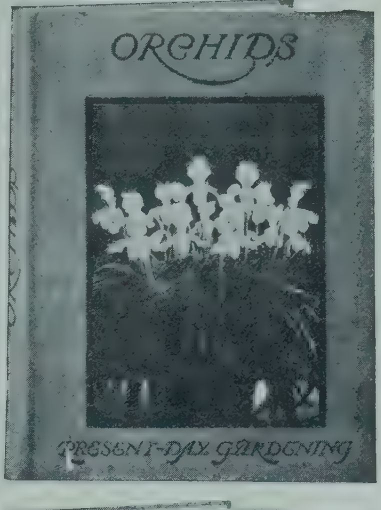
Present-Day Gardening Series





1/6 Net PER VOLUME.

Edited by R. Hooper Pearson, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. Cook, Head Gardener to Queen Alexandra at Sandringham; James Douglas, V.M.H.; and J. F. M'Leod, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By William Watson, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir Fred. W. Moore, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. Grove, F.L.S., with Preface by H. J. Elwes, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. Rickatson Dykes, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. Curtis, Hon. Sec. of the National Sweet Pea Society.

The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. Darlington, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

Roses is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. Jacob, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. Wilks, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By William Cuthbertson, J.P., and R. Hooper Pearson.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by Thos. Stevenson.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By Alexander Dean, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By George Bunyard, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

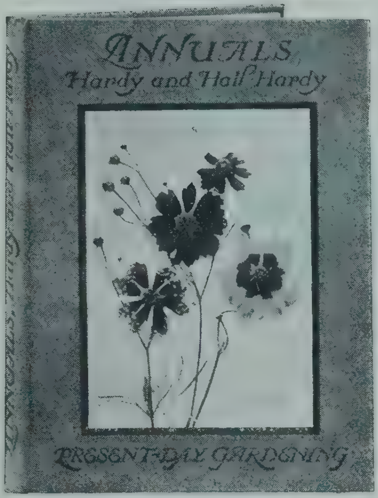
Present-Day Gardening Series



1/6 Net PER VOLUME.

Edited by R. HOOPER PEARSON, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. COOK, Head Gardener to Queen Alexandra at Sandringham; JAMES DOUGLAS, V.M.H.; and J. F. M'LEOD, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By WILLIAM WATSON, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir FRED. W. MOORE, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. GROVE, F.L.S., with Preface by H. J. ELWES, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. RICKATSON DYKES, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. CURTIS, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. DARLINGTON, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

ROSES is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. JACOB, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. WILKS, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By JAMES O'BRIEN, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By WILLIAM CUTHBERTSON, J.P., and R. HOOPER PEARSON.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By HORACE J. WRIGHT, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by THOS. STEVENSON.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By ALEXANDER DEAN, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By GEORGE BUNYARD, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

Each Volume 1/10 post free (ROSES 2/10 & 3/10) to be obtained from The PUBLISHER, GARDENERS' CHRONICLE, 41, Wellington Street, Covent Garden, London, W.C.

MARKETS.

COVENT GARDEN, *August 28.*

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Remarks.—Apples, both dessert and culinary, continue to arrive in large quantities, and can only be disposed of at very low prices. These remarks also apply to the commoner Pears. Some very fine Williams's Bon Chrétien Pears are arriving from France and supplies from California are anticipated. Plums from the same source are now arriving, carefully graded and packed in boxes; these fruits present a very attractive appearance. English Plums consist principally of the following varieties: Monarch, Pond's Seedling, Victoria, and Magnum; Damsons are also very plentiful and cheap. Selected, highly-coloured Peaches and Nectarines are in demand, but the supply of second-rate fruits is greatly in excess of the requirements. Large supplies of English and Continental Tomatos reach the market daily and prices rule very low. The supplies of Melons and Figs exceed the demand. The market is over-supplied with Grapes, and some kinds are selling at 3d. per pound. Large quantities of Walnuts, Filberts, and Cobs are arriving, and as the crops are very heavy this condition is likely to continue. The Vegetable market continues to be well supplied with all seasonable kinds of Vegetables. *E. H. R., Covent Garden, August 28, 1912.*

New Potatos.

	per cwt. s.d. s.d.
Bedfords	4 0- 5 0
Kents	4 6- 5 3

	per cwt. s.d. s.d.
Blacklands	4 0- 4 9
Lincolns	4 3- 4 9

Remarks.—As there are very few arrivals on account of the wet weather, the prices have advanced. The country is very badly flooded throughout the Fens, and a large area of Potato land is under water. *Edward J. Newborn, Covent Garden and St. Pancras, August 28, 1912.*

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending August 24, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather.*—The general condition was again extremely unsettled over the kingdom as a whole, but in some localities in Scotland, Ireland, and the north-east of England rain was less common than elsewhere. Thunderstorms occurred in many parts of England during the earlier half of the week, especially in the eastern half of the country.

The *temperature* continued below the normal, the deficit exceeding 3° in most districts. The highest of the maxima occurred at most stations early in the week, and ranged from 70° in England S.W. to 63° in Ireland N. At many places in the north-west and north the maxima were below 60° on several successive days. The lowest of the minima, which were mainly recorded between the 21st and 23rd, varied from 32° in Scotland E., 35° in Scotland N., and 37° in Ireland, to 45° in England E. and to 52° in the English Channel. The lowest grass readings were 27° at Crathes, 28° at Balmoral, 30° at Marlborough, and 31° at Cheadle and Markree Castle. Throughout the whole kingdom the thermometer, at 1 foot below the surface of the soil and also at 4 feet, was below the normal.

The *rainfall* was more than the mean in all districts except Scotland W., the excess being large generally. Over a considerable portion of England more than twice, and in England S.W. nearly three times as much as the average quantity was registered. Measurements of an inch and above for a period of 24 hours were numerous, the largest amounts being 1·30 in. at Glencarron on the 20th, 1·48 in. at Manchester, and 1·52 in. at Arlington (North Devon) on the 23rd, 1·55 in. at Foynes on the 22nd, and 1·63 in. at Over Court (Bristol) on the 19th.

The *bright sunshine* was everywhere much in defect. In England S.W. the mean daily duration was less than 2 hours, and in England S.E., where it was highest, it was no more than 3·3 hours. In the latter district the percentage of the possible duration was 23, in the English Channel 22, and in England E. 21. In England S.W. and Scotland E. it was only 13.

THE WEATHER IN WEST HERTS.

Week ending August 28.

Cold, excessively wet, and exceptionally gloomy.—For more than a month there has not occurred a single unseasonably warm day, while the nights during the same period have been mostly cold for the time of year. On the coldest day of the past week (the 26th) the temperature in the thermometer screen never rose higher than 56°, which is about 12° colder than is usual at the end of August. On the last night of the week the exposed thermometer registered 2° of frost, making this the coldest night I have recorded here in August since 1886—or for 26 years. At 2 feet deep the ground is still 3° colder, and at 1 foot deep 4° colder, than is seasonable. Rain fell on each of the 13 days ending the 26th, and to the aggregate depth of 2½ inches, which is exactly the average quantity for the whole of August, and equivalent to 12 gallons on each square yard of surface in my garden. On the 26th rain began falling at 3.30 a.m., and continued almost without intermission until 9.30 p.m.—or for 18 hours, the total fall amounting to over three-quarters of an inch. Of the 12 gallons of rainwater mentioned above 8 gallons has passed through the percolation gauge on which short grass is growing, and 8½ gallons through the bare soil gauge. This proved another remarkably gloomy week, the average record of bright sunshine being less than three hours a day, which is only about half the usual duration for this period in August. On three days no sunshine at all was recorded. The winds were rather high at the beginning of the week, but in no hour did the mean velocity exceed 15 miles. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by as much as 11 per cent. *E. M., Berkhamsted, August 28, 1912.*

GARDENING APPOINTMENTS.

Mr. A. Mitchison, Foreman at Elvetham Park, Winchfield, Hampshire, as Gardener to Colonel Duncombe, Waresley Park, Sandy, Bedfordshire.

Mr. John Hay, of the Royal Gardens, Windsor, and previously of Welbeck Abbey and Ruyton Park, as Gardener to Madame Ephrassi, Ile de France, St. Jean, Cap Ferrat, Alpes Maritimes, France.

Mr. F. J. Foster, for the past 5 years Gardener to Mr. J. F. H. Harter, Cranfield Court and Biddlesden Park, previously for 5 years General Foreman at Petworth House Gardens, as Gardener to the Earl of Ancaster, Grimsthorpe, Castle Bourne.

Mr. A. Hather, for the past 2 years Gardener to Miss Butler, Ashlands, Billesdon, Leicester, as Gardener to Colonel Denison, Eaton Hall, Retford, Nottinghamshire.

Mr. J. Vawdrey, for the past 9 years Foreman at Jodrell Gardens, and previously at Powis Castle Gardens, as Gardener to T. E. Tatton, Esq., Wythenshawe Hall, Northenden, Cheshire.

Mr. W. H. Jenkins, for 9 years Gardener at Wythenshawe Hall Gardens, Northenden, Cheshire, as Superintendent of Parks and Recreation Grounds, Beckenham, Kent.

Mr. Geo. Robarts, late of Winchmore Hill, London, N., as Gardener to Paul E. Schweder, Esq., Courtlands, Goring-by-Sea, Sussex.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the GARDENERS' CHRONICLE."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

CLAY'S LONDON FERTILIZER

TRADE MARK.

Every TIN, BAG & SEAL bears this TRADE MARK—the only Guarantee of Genuineness.

"A GRAND FERTILIZER"

"The value of CLAY'S FERTILIZER needs little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. . . . The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur gardeners are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."

NURSERYMAN AND SEEDSMAN, 20th July, 1912.

"Gardeners' Chronicle" Offices, 41, Wellington St.,
Covent Garden, London, W.C.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the GARDENERS' CHRONICLE."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

Present-Day Gardening Series

1/6 Net PER VOLUME.

Edited by R. HOOPER PEARSON, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. COOK, Head Gardener to Queen Alexandra at Sandringham; JAMES DOUGLAS, V.M.H.; and J. F. M'LEOD, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By WILLIAM WATSON, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir FRED. W. MOORE, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. GROVE, F.L.S., with Preface by H. J. ELWES, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. RICKATSON DYKES, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. CURTIS Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. DARLINGTON, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

ROSES is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. JACOB, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. WILKS, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By JAMES O'BRIEN, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By WILLIAM CUTHBERTSON, J.P., and R. HOOPER PEARSON.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By HORACE J. WRIGHT, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by THOS. STEVENSON.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By ALEXANDER DEAN, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By GEORGE BUNYARD, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

Each Volume 1/10 post free (ROSES 2/10 & 3/10) to be obtained from The PUBLISHER, GARDENERS' CHRONICLE, 41, Wellington Street, Covent Garden, London, W.C.

ARTISTIC HERBACEOUS BORDERS. "Colour is meant for the perpetual comfort and delight of the human heart."—*Ruskin.* THE MOST BEAUTIFUL COLOUR EFFECTS it is possible to obtain with flowers are those provided by the Kelway Borders. LET US SUGGEST A SELECTION of plants for the space you have, whatever its size, and we will make it a picture of continual bloom for many years.

From ——, Burdon Lane, Belmont, Surrey. 23rd August, 1912. "The Borders that you arranged for us have done splendidly. The Lupins and Delphiniums are still flowering well, and I really believe they have bloomed continually since April. The Delphiniums were so early. Also the Anchusa was really perfectly beautiful for a very long time."

Write at once for "Gardens of Delight," 6d., post free.
KELWAY & SON, The Royal Horticulturists, Langport, Somerset.

NATIONAL INSURANCE ACT, 1911.

ALL GARDENERS whether employed in Nursery, Public, Private or Market Gardens or Seed Warehouses, and who have become "Insured Persons" under the National Insurance Act, on July 15th, 1912, **Must Join an "Approved Society" to obtain the Full Benefits of the Act.**

THE BEST SOCIETY FOR A GARDENER TO JOIN IS

The United Horticultural Benefit & Provident Society

(The Gardeners' Own Friendly Society), Registered No. 208, London.

Registered Office & Meeting Place: **Royal Horticultural Hall, Vincent Sq., Westminster, S.W.** Established in 1865.
Managed Entirely by Gardeners, and Certified Actuarily Sound and Solvent, with over £40,000 Invested.

There is no Society in the Kingdom that can give better Benefits under the National Insurance Act to the Gardener, and if additional Benefits are desired, no other Society offers Gardeners such an opportunity of obtaining the same for a small additional contribution.

At the General Meeting held on June 17th, 81 out of a total of 84 members present were in favour of the Society becoming Approved.

Application Forms for membership can be obtained from **A. C. HILL**, Sec. pro. tem., **35, Alexandra Rd., W. Kensington Pk.**

FOR SALE, three good specimen Anthurium Scherzerianum; seven large specimen Eucharis amazonica; five large tubs Hydrangea hortensis; all good specimens.—Apply to Mr. J. VESSEY, The Gardens, Kenwick Hall, Louth, Lincolnshire.

PLANTS for SALE, in 10-inch pots, Allamanda Hendersonii, Williamsii, Clerodendron Balfouri, Ixora amabilis Duffii, Prince of Orange, Kentia Belmoreana.—F. LAMBERT, Brogynlyn Gardens, Oswestry, Salop.

FOR SALE, Geranium Cuttings Jacoby and Golden Harry Hieover.—W. PENNY, The Gardens, Hall Place, Maidenhead.

20,000 GOLDEN EUONYMUS (ovata aurea), 9-18 inches; samples and prices on application. 400 Cupressus macrocarpa, 4-5 feet, in pots, cheap to clear. Large Green Euonymus for screen work; state requirements.—
H. H. MOORE & SONS, Nurseries, Chichester.

ROSES, short, extra strong, best varieties, 18s. per 100, £8 per 1,000; Decorating and Hedge Shrubs, Fruit and Avenue Trees, &c.; cheapest prices; catalogue on request.—FRAHM, Tree Nurseries, Elmshorn, near Hamburg, Germany.

GERANIUMS.—Strong rooted Cuttings, Paul Crampel, 10s. per 100; Jacoby and Denmark, 8s.; Crousse, 7s.—
PARMENTER & CORNEY, Basildon, Essex.

KENTIA PALMS (16), 4½ to 8 feet, with six to eight leaves; one Areca Baurei in tub, 12 feet; two large Dracæna Doucetii, several Aspidistras.—Apply, G. WATTS, Stargroves, Woodhay, Newbury.

PINKS (for edging), Her Majesty, large quantity of rooted pipings, cheap to clear; write for sample.—C. A., Box 1, 41, Wellington Street, Covent Garden, W.C.

CINERARIA MAXIMA and STELLATA from Exhibition strain; Primula malacoides and Streptocarpus kewensis, all extra strong, 1s. 3d. dozen, carriage paid.—KOERING, The Nursery, 110, Brockley Road, S.E.

VIOLETS.—Good strong clumps of Marie Louise, well set with flower-bud, 3s. doz. c.w.o.—H. HARRIS, Writter Road Nursery, Chelmsford.

MALMAISONS.—Surplus Layers in 12 or 15 best varieties; list 5s. per doz., 30s. per 100, carriage paid.—JUSTICE, Alvaston, Nantwich.

FOR SALE.—Quantity of CYPRIPEDIUMS and small collection of Greenhouse Plants.—Apply, MARCHAM, Boldre Grange Gardens, Lymington.

MISCELLANEOUS.

SPHAGNUM-MOSS, fresh, clean, 5s. bag; Peat, good brown, six bags, 9s.; 10 yards in truck, 70s.; Fibrous Loam, 10 yards in truck, 80s.; Bonemeal, 8s. cwt.; Charcoal, best, 7s. 6d. per cwt.—ALBERT HEAD, Seaford Road, Wokingham.

PEAT! PEAT!! PEAT!!!—In consequence of a death and the estate being sold, three acres of the finest Peat has to be cleared. The price of the same, suitable for Orchids, at 10s. 6d. per cubic yard, 3s. 6d. per sample sack; the remainder, a good general Peat, at 7s. 6d. per yard, not less than six yard truck loads in any case, or the latter, in well-filled bags, six at 2s. 6d. each. I have made arrangements with the railways for a special cheap rate for same.—Apply to Sole Agent, GEO. B. DENNIS, Esq., Hanworth, Middlesex.

A. B. JOHNSTON, New Park, Cranleigh, Guildford.

RANSOMES' LAWN SWEEPERS

have proved themselves most effective in use, and economical in time, as compared with the tedious process of sweeping by hand. The brushes sweep up the leaves, stones, fir cones, needles, worm casts, etc., all being gathered up in a rapid and satisfactory manner. The action of the machine has also a most excellent effect upon the appearance of the grass

Width - 24 in.
Easily worked by one man.

On no consideration whatever will any exception be made to this rule.

MARKETS.

COVENT GARDEN, September 11.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—Very large supplies of both dessert and cooking Apples continue to arrive, and their prices are low. The first shipment of Apples arrived from Wenatchee Valley, Washington State, U.S.A., this week; those of the variety Gravenstein were packed in boxes which contained about 10 dozen fruits each. The consignment also included a few cases of very fine fruits of Williams's Bon Chrétien Pears. France and California are also contributing large supplies of Pears in addition to fruit from Kent and Middlesex. Consignments of English Plums are fewer. Some good samples of Californian Plums are obtainable packed in trays and boxes. It is anticipated that the supplies of Apples from Canada and America will be much larger than in any previous season. The first shipments are due to arrive next week. Damsons have met a good market at the prices quoted last week. Blackberries continue a good supply. Grapes have shown a slight improvement in demand in spite of the fact that supplies are still large. Figs and Melons still remain scarce and there is a slight increase in their value. Peaches are a limited supply. Cobnuts and Filberts are very plentiful. There are fairly large quantities of French Walnuts. The market is heavily supplied with Tomatos, both home grown and continental, there being a further decrease in their prices. The Vegetable trade this week shows a slight improvement; the market is well supplied with vegetables. *E. H. R., Covent Garden, September 11, 1912.*

REMARKS.—Prices are the same as last week, and the condition of trade remains unaltered. *Edward J. Newborn, Covent Garden and St. Pancras, September 11, 1912.*

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending September 7, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather*.—As a whole, the conditions were much drier than of late, and also less cloudy, but rain fell on most days in the north. In the south and south-east of England the greater part of the week was dry. A thunderstorm occurred at Geldeston on the 6th.

The *rainfall* was below the average in Ireland and in all parts of England except the north-west, but in Scotland there was a large excess. Nearly all stations in Scotland W., as well as West Linton, experienced more than an inch on the 3rd, the largest amounts being 1·5 inch at Glasgow, 1·6 inch at Rothesay, 1·8 inch at Cally, Gatehouse, 2·1 inches at Fort William, and 2·4 inches at Poltalloch. At this last station 1·1 inch fell on the 7th. At several places in the Midlands and south-east of England rain fell on one day only.

The *bright sunshine* was below the average in all districts. In Ireland and the north and east of Scotland the mean daily duration was less than 3 hours, but in England N.E., E. and S.E. it was more than 4½ hours. The percentage of the possible duration ranged from 37 in England E. and 36 in England S.E., to 16 in Scotland N. and to 15 in Ireland N.

THE WEATHER IN WEST HERTS.

Week ending September 11.

The sixth cold and sunless week in succession.—There has not been a single unseasonably warm day during the whole of the last six weeks, while most of the nights have also been cold for the time of year. Of those six weeks the past week was much the coldest. On one day the temperature in the thermometer screen did not rise higher than 51°, which is 14° below the average maximum reading for the month. On two nights the exposed thermometer registered respectively 1° and 2° of frost. At 2 feet deep the ground is at the present time 3° colder, and at 1 foot deep 6° colder, than is seasonable. Some rain fell on three days, but the total measurement for the week only amounted to about one-tenth of an inch. No measureable quantity of rain-water has now passed through either of the percolation gauges for eight days. The sun shone on an average for 4½ hours a day, which is three-quarters of an hour a day short of the usual duration for the beginning of September. The winds proved as a rule rather high, but in no hour did the mean velocity exceed 14 miles. Since the present month began the winds have come mostly from some northerly point of the compass. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by seven per cent.

AUGUST.

The coldest, wettest, and most sunless August for at least 26 years.—This was the coldest August during the 26 years over which my records at Berkhamsted extend. Both the days and nights were also as a rule colder than any previously experienced here, but the nights were not nearly as exceptionally cold for the time of year as the days—the mean maximum temperature being as much as 7° colder, while the mean minimum was only about 2° colder, than their respective averages for August. The extreme maximum temperature was also equally exceptional, the highest reading in the thermometer screen at no time exceeding 68°. The extreme minimum temperature on the grass, 30°, was also very nearly as exceptional. Rain fell on as many as 26 days, or nearly twice the average number for the month. The total measurement was nearly 5 inches, or 2½ inches in excess of the average for the month—making this the wettest August since 1881, or for 31 years. The sun shone on an average for only 3½ hours a-day, which is 2¾ hours a-day short of the average duration for the month. In no previous August during the past 26 years have I recorded so little sunshine. The winds were, as a rule, high, but in no hour did the mean velocity exceed 15 miles—direction west. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by as much as 9 per cent. In only two of the previous 26 years has the air in August at that hour been as humid.

THE SUMMER.

A very cold and wet and remarkably sunless summer.—June and July were of about average temperature, while August proved the coldest I have yet recorded here. June was rather wet, July rather dry, and August exceptionally wet. In June there was an average duration of sunshine, while July was very sunless, and August remarkably sunless. Taking this season as a whole we have to go back to 1888, or for 24 years, to find a summer with as little sunshine. *E. M., Berkhamsted, September 11, 1912.*

CLAY'S LONDON FERTILIZER
TRADE MARK.
Every TIN, BAG & SEAL bears this TRADE MARK—the only Guarantee of Genuineness.

"A GRAND FERTILIZER"

"The value of CLAY'S FERTILIZER needs little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. . . . The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur gardeners are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."

NURSERYMAN AND SEEDSMAN, 20th July, 1912.

THE REPUTATION OF A FIRM

depends upon the reliability and quality of goods supplied, the low prices charged to enable buyers to gain an advantage, and the facilities for expeditiously dealing with the work entrusted to them.

We are in a position to meet these requirements, and will gladly send copies of our Catalogues, which will interest you if you are interested in gardening, and show you that we understand our business.

We issue the following:

1. **Hardy Plants**, describing one of the most representative and extensive collections of Herbaceous and Rock and Alpine Plants in existence.
2. **Bulbs, Fruit Trees, Roses, Climbing Plants, etc.**, an up-to-date descriptive list comprising all the best varieties
3. **Aquatics, Bog and Water Plants**, a list of those varieties and kinds really worth growing.

(1912 PATTERN).

Write to us, and we shall have pleasure in sending you plans and all the information you desire.

PAUL HANSCHITZ, ST. CATHERINE'S, —GUILDFORD.—

(Agent for all Countries).

RANSOMES' LAWN SWEEPERS

have proved themselves most effective in use, and economical in time, as compared with the tedious process of sweeping by hand. The brushes sweep up the leaves, stones, fir cones, needles, worm casts, etc., all being gathered up in a rapid and satisfactory manner. The action of the machine has also a most excellent effect upon the appearance of the grass

Width - 24 in.

Easily worked by one man.

£5 : 5 : 0

RICHARD SANKEY & SON, LTD.,

Bulwell Potteries, NOTTINGHAM.

NATIONAL INSURANCE ACT, 1911.

ALL GARDENERS whether employed in Nursery, Public, Private or Market Gardens or Seed Warehouses, and who have become "Insured Persons" under the National Insurance Act, on July 15th, 1912, **Must Join an "Approved Society" to obtain the Full Benefits of the Act.**

THE BEST SOCIETY FOR A GARDENER TO JOIN IS

The United Horticultural Benefit & Provident Society

(The Gardeners' Own Friendly Society), Registered No. 208, London.

Registered Office & Meeting Place: **Royal Horticultural Hall, Vincent Sq., Westminster, S.W.** Established in 1865.

Managed Entirely by Gardeners, and Certified Actuarially Sound and Solvent, with over £40,000 Invested.

There is no Society in the Kingdom that can give better Benefits under the National Insurance Act to the Gardener, and if additional Benefits are desired, no other Society offers Gardeners such an opportunity of obtaining the same for a small additional contribution.

At the General Meeting held on June 17th, 81 out of a total of 84 members present were in favour of the Society becoming Approved.

Application Forms for membership can be obtained from **A. C. HILL,** Sec. pro. tem., **35, Alexandra Rd., W. Kensington Pk.**

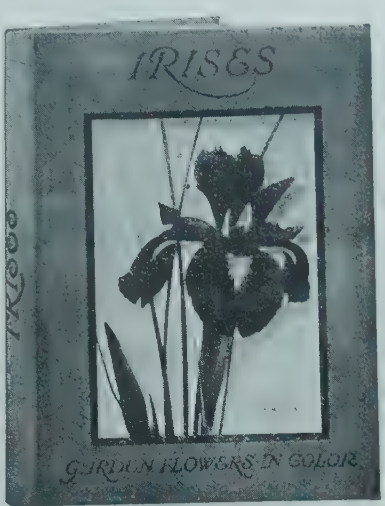
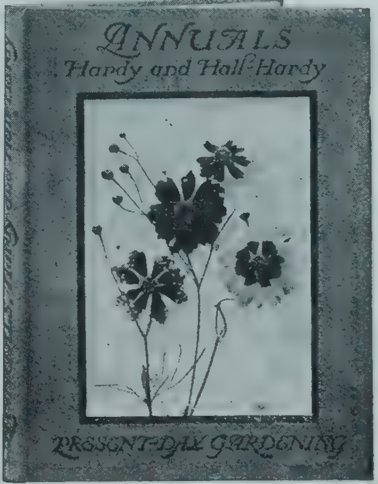
Present-Day Gardening Series





1/6 Net PER VOLUME.

Edited by R. Hooper Pearson, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. Cook, Head Gardener to Queen Alexandra at Sandringham; James Douglas, V.M.H.; and J. F. M'Leod, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By William Watson, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir Fred. W. Moore, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. Grove, F.L.S., with Preface by H. J. Elwes, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. Rickatson Dykes, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. Curtis, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. Darlington, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

Roses is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. Jacob, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. Wilks, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By William Cuthbertson, J.P., and R. Hooper Pearson.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by Thos. Stevenson.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By Alexander Dean, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By George Bunyard, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

Each Volume 1/10 post free (ROSES 2/10 & 3/10) to be obtained from The PUBLISHER, GARDENERS' CHRONICLE, 41, Wellington Street, Covent Garden, London, W.C.

MARKETS.

COVENT GARDEN, September 18.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Watercress, p. dz. bunches	0 5- 0 7

Remarks.—Apples are arriving in large quantities from all sources; the Colonial output is anticipated to be the largest on record. A consignment of Pears of the variety Beurré Superfin, packed in boxes, arrived this week from Oregon in a very satisfactory condition. The market is also well supplied with very fine fruits of French and Californian Pears of the variety Doyenné du Comice. Home growers are contributing some very large fruits of such varieties as Marguerite Marillat, Pitmaston Duchess and Souvenir du Congrès. English Plums are almost finished, but a good supply of Prune Plums is arriving principally from Bedfordshire. There are also some good samples of Californian Plums sent in trays and boxes. Damsons are a limited supply. Sloes are a very heavy crop this year and Blackberries are especially plentiful. There continues a very heavy supply of English Grapes, for which there is a moderate demand. Supplies of English and Channel Island Figs are decreasing; Italian consignments, however, seem to be very plentiful. The first consignments of Peaches from Ontario came to hand this week. English Peaches still continue to arrive in limited quantities. The supplies of Melons are shorter, and higher prices are being obtained for good fruits. English and French Walnuts are plentiful. There is also a heavy supply of Cobnuts, which are cheap. The English supplies of Tomatos have not been quite so heavy during the past week, consequently their prices have advanced; there has also been a falling off in the Continental supplies of this fruit. The vegetable trade has shown a slight improvement during the week, with no apparent falling off in supplies. *E. H. R., Covent Garden, September 18, 1912.*

New Potatos.

DEBATING SOCIETIES.

CROYDON & DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT.—The usual fortnightly meeting of this society took place on the 3rd inst., at the Sunflower Temperance Hotel, George Street. Mr. C. H. Dyke presided over a good attendance of members, and Mr. E. Burge, The Lodge, Oakwood, Beckenham, delivered a discourse on the United Horticultural Benefit and Provident Society.

NEW INVENTION.

MOSS AND WEED DESTROYER.

Mr. E. J. Wootten, Fairoak, Eastleigh, has sent us a small two-ended hoe, specially designed for removing Moss and weeds from the surface of flower pots. The tool is 8 inches in length and weighs only 4 ounces. The ends are shaped like diminutive hoes, and are of two sizes, for use in large and small pots.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending September 14, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather*—Over the kingdom generally the weather was mostly dry, although seldom bright, but in the north-east and east of Great Britain rain was again experienced early in the week.

The *temperature* continued below the average, the divergence being 4° or more in all districts, and as much as 6° in England S.E. The highest of the maxima were mostly recorded either on the 8th or 13th, and ranged from 69° in Scotland E. and 68° in England N.E. to 63° in England N.W. and Ireland N. On the 9th and 10th maximum readings below 55° were recorded over a large portion of Great Britain; at some stations in the north of Scotland the thermometer did not reach 50°. The lowest of the minima which occurred on various dates, ranged from 29° in Scotland W. and 30° in Scotland E., to 41° in England E. and to 43° in the Channel district. The lowest grass readings reported were 25° at Newton Rigg, 26° at Glasgow, and 27° at Burnley, Aspatria and Southport. The temperature of the soil continued below the normal at a depth of 1 foot and also at 4 feet.

The *mean temperature of the sea* was very generally below the normal, and also lower than during the corresponding week of last year. The values ranged from 59° at Newquay and 57° at several other places in the south-west, south and south-east to 49° at Kirkwall and Burnmouth.

The *rainfall* exceeded the normal in Scotland E. and England E., but was below it elsewhere, the fall generally being very slight. At many stations in the west, south and south-east the week was rainless.

The *bright sunshine* was a little above the average in Ireland and Scotland N. and W., much below it elsewhere. In all parts of England except the south-west the mean daily duration was less than 3 hours, and in the north-east, east and south-east districts, it was less than half the average. The percentage of the possible duration ranged from 38 in Scotland W., 37 in Ireland S. to 19 in England E. and the Midland Counties, and to 16 in England N.E.

THE WEATHER IN WEST HERTS.

Week ending September 18.

The seventh cold and sunless week in succession.—Another cold week. In fact, during the last seven weeks there has not been a single unseasonably warm day, although the nights have been occasionally above the average in temperature. During the past week there occurred only one such night, and on three nights the exposed thermometer fell to within 2° of the freezing point. The ground is now 3° colder than is seasonable both at 1 foot and 2 feet deep. A little rain fell on the first day of the week (the 11th), but since then no measureable quantity has fallen. Since the present month began the total rainfall has amounted to less than a quarter of an inch—making these 18 days the longest and driest period since April, or for over four months. No measureable quantity of rain-water has come through either of the percolation gauges for over a fortnight. The sun shone on an average for only 51 minutes a day during the week, which is four hours a day short of the average duration for the middle of September. Light airs and calms have alone prevailed, and these light airs have come almost exclusively from the north-west. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by eight per cent. *E. M., Berkhamsted, September 18, 1912.*

TRADE NOTICE.

MESSRS. WM. WATSON & SONS, LTD.

THIS firm has purchased the interest in the lands of Kilbogget Farm, Killiney (consisting of 148 acres, opposite Killiney Golf Links), for the development of their nursery business, but communications should continue to be addressed to the head office at Clontarf. The firm will continue under the management of the joint proprietors, Messrs. James and John Matchett Watson.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the Gardeners' Chronicle."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

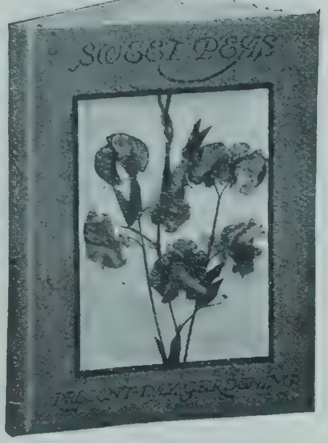
Present-Day Gardening Series



1/6 Net PER VOLUME.

Edited by R. Hooper Pearson, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. Cook, Head Gardener to Queen Alexandra at Sandringham; James Douglas, V.M.H.; and J. F. M'Leod, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject*) By William Watson, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir Fred. W. Moore, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. Grove, F.L.S., with Preface by H. J. Elwes, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. Rickatson Dykes, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. Curtis, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. Darlington, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

Roses is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. Jacob, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. Wilks, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By James O'Brien, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By William Cuthbertson, J.P., and R. Hooper Pearson.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By Horace J. Wright, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by Thos. Stevenson.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By Alexander Dean, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By George Bunyard, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

Each Volume 1/10 post free (ROSES 2/10 & 3/10) to be obtained from The PUBLISHER, GARDENERS' CHRONICLE, 41, Wellington Street, Covent Garden, London, W.C.

MARKETS.

COVENT GARDEN, *September 25.*

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Remarks.—The principal varieties of English culinary Apples are Peasgood's Nonesuch, Warner's King, Bismarck, Lane's Prince Albert, and Lord Derby; and dessert varieties consist mainly of Cox's Orange Pippin, Chas. Ross, Worcester Pearmain, and Allington Pippin. The overseas arrival per s.s "Olympic" this week consisted of 190 boxes of Gravensteins, 307 boxes of Jeffries, and 132 boxes of King of Tompkins County, making the total number of 629 boxes. English dessert varieties of Pears are Doyenné du Comice, Beurré Hardy, Calabash, Louise Bonne of Jersey, Pitmaston Duchess, and Fertility. The supply of Hazels has finished. Imported Pears consist of the following varieties: Williams's Bon Chrétien, Beurré Superfin, and

well graded. English crops of Plums are nearly over, and supplies are now limited to Prunes and German Sweitzers. The supply of Damsons has finished. Sloes are in excess of the demand. A shipment of several thousands of boxes of Italian Prunes arrived this week, containing about 24 lbs. of fruit in each box. They were in excellent condition for either dessert or culinary purposes. Blackberries continue a heavy supply. English Muscat Grapes show a slightly better trade. There still remains a very heavy supply of other varieties, which can only be cleared at low rates. Figs consist principally of the Italian kinds, packed in boxes of one dozen fruits. Supplies of Melons are shortening and prices advancing. A few late varieties of English Peaches still continue to arrive, and fairly heavy consignments of American Peaches are to hand packed in boxes containing 18 fruits or more. Cranberries, in cases of 20 to 30 quarts, are arriving from Cape Cod and Holland, the latter being very fine berries. The consignments of English and Channel Islands Tomatos are now gradually shortening, and the first shipments from Canary Islands are due next week. There still continues to be a very heavy supply of Cobnuts and Walnuts, the bulk of the latter consignments being from France. English Corn Cobs are obtainable, but are not so plentiful this season as in past years. With regard to the Vegetable Market, there is little or no change to report this week. *E. H. R., Covent Garden, September 25, 1912.*

New Potatos.

	per cwt. s.d. s.d.

DEBATING SOCIETIES.

PANGBOURNE & DISTRICT GARDENERS'.—This association held its annual non-competitive exhibition of Fruit, Flowers and Vegetables on September 18. Some of the exhibits were exceptionally good, several certificates of merit being awarded. The exhibition was opened to the public for a short time, after which the ordinary meeting of the association was held, and the officers and committee

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending September 21, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather* was rainless over nearly the whole of the United Kingdom, and in many districts, especially in Ireland and the western parts of Britain, the atmosphere was brighter than during the preceding weeks.

The *temperature* was again below the normal, except in the north and east of Scotland, where it was slightly above. The highest of the maxima, which were recorded during the earlier half of the week, ranged from 72° in Scotland E., England S.W., and Ireland S., to 64° in England E. At various stations the maxima were below 60° on several days. The minima occurred as a rule in the latter half of the week, and were generally rather low for the time of the year. In Scotland E. (at Balmoral on the 21st), the thermometer fell to 31°, and elsewhere the lowest readings ranged from 35° in Scotland W., England N.W., S.E., and the Midland Counties to 40° in Ireland S., and to 49° in the English Channel. The lowest grass readings were 26° at Newton Rigg, 27° at Greenwich and Balmoral, and 28° at Kew, Wistley, and West Linton. The temperature of the soil at a depth both of 1 foot and 4 feet was below the average, and also lower than in the corresponding week of last year.

The *rainfall.*—Over the greater part of England and in the west of Scotland there was no rain, and elsewhere only a few hundredths of an inch were recorded.

The *bright sunshine* was below the normal over the eastern half of the Kingdom, but above it in the western section. The percentage of the possible duration ranged from 60 in the English Channel, and 47 in England S.W. to 24 in England E. and to 20 in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending September 25.

The eighth cold week in succession, and the first unseasonably sunny one since July.—Still another cold week, and the eighth cold one in succession. There was one day during the past week of average temperature, but all the other days were more or less cold for the time of year. In fact, taking the last 60 days, there has not been a single unseasonably warm day, and during the same period but few warm nights. On the night of the 24th inst. the exposed thermometer registered 6° of frost, making this the coldest night as yet this autumn, and also the coldest night in September for 23 years. The ground is at the present time 3° colder at 2 feet deep, and 5° colder at 1 foot deep, than is seasonable. No measurable quantity of rain has now fallen for a fortnight, and the total rainfall since the present month began amounts to less than a quarter of an inch. There has been no percolation at all through either of the soil gauges for the last five days. The sun shone on an average for 5½ hours a day during the week, which is three-quarters of an hour a day in excess of the average for the time of year. This was the first week for 10 weeks in which the duration of bright sunshine has been longer than is seasonable. Calms and light airs have alone prevailed, and the direction of these light airs has been persistently from some easterly point of the compass. The mean amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by 5 per cent. *E. M., Berkhamsted, September 25, 1912.*

SCHEDULES RECEIVED.

Society of American Florists and Ornamental Horticulturists.—The third international flower show of this society will be held at the New Grant Central Palace, New York, from April 5 to 12, 1913. Secretary, Mr. John Young, 54, West 28th Street, New York.

CLAY'S LONDON FERTILIZER
TRADE MARK.
Every TIN, BAG & SEAL bears this TRADE MARK—the only Guarantee of Genuineness.

"A GRAND FERTILIZER"

"The value of CLAY'S FERTILIZER needs little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. . . . The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur gardeners are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."
NURSERYMAN AND SEEDSMAN, 20th July, 1912.

The
Selborne Society.

President:
The Rt. Hon. Lord Avebury, D.C.L., F.R.S.
Vice-President:
The Rt. Hon. Lord Montagu of Beaulieu.

THE Objects are to promote the study of Natural History, to preserve wild animals and plants, and to protect places of antiquarian interest or natural beauty.

A subscription paid now (minimum **5**/-) need not be renewed until January, 1914, and entitles a member to a copy of **"The Selborne Magazine"** each month, as well as to attend the Lectures and Excursions.

A "Selborne" Nesting Box.

Birds add greatly to the interest of a Garden, and useful ones can be encouraged.

The Bird Sanctuary Committee gives advice on the Attracting and Protecting of Birds.

The Selborne Society has recently published

A Nature Calendar,
By Gilbert White.

Copies may still be had of the Collector's Edition de Luxe in facsimile (250 copies only) on Italian hand-made paper, with deckle edges, bound in green sail cloth. Price 25/-, post free 25/6.

The Times says: "The Secretary of the Selborne Society has performed a pleasurable act of piety by producing this attractive facsimile."

The Daily Telegraph says: "The appearance of a new work from the hand of Gilbert White is certainly a striking literary event. . . . . It is a beautiful book that the Selborne Society has made, and owners of the two hundred and fifty copies to which the issue is limited, will treasure their property."

Nature says: "The printing, paper, and binding of this large volume are all admirable, and the brief introduction is adequate. It is a superb volume to lie on the drawing room table."

For all particulars apply to

Wilfred Mark Webb, F.L.S.,
General Secretary,
42, Bloomsbury Sq., London, W.C.

MARKETS.

COVENT GARDEN, October 9.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Remarks.—English dessert and culinary Apples have been a shortage during the past week. Apples from Nova Scotia, Wenatchee and California comprised choice fruits of the following varieties:—Gravenstein, Jonathan, Blenheim Pippin, Ribston Pippin, and Winter Banana, a yellow sort. Fine samples of Pears from the same sources include Beurré Hardy, Duchess, Easter Buerré, Keiffer, and Doyenné du Comice. English Pears, obtainable in Covent Garden Market, consist of the following sorts: Durondeau, Pitmaston Duchess, Conference, Calabash, Beurré Clairgeau, and Doyenné du Comice, most of the fruits being of excellent quality. Californian growers are also sending some very fine samples of Switzer Prunes and Coe's Golden Drop Plums; these fruits are carefully graded and packed in trays, four in a box, the total weight being about 24 lbs. Grapes from home growers and the Channel Islands remain a very heavy supply, and sales are only effected at very low prices. English Tomatos continue a good supply; supplies of Dutch and French Tomatos are finished, but there will soon be consignments from the Canary Islands. Mushrooms, both field and cultivated, have been very scarce; the latter have realised from 2s. to 2s. 6d. per lb. English and Continental Nuts continue a full supply. The vegetable trade has shown a slight improvement during the past week. *E. H. R., Covent Garden, October 9, 1912.*

New Potatos.

	per cwt. s.d. s.d.
Bedfords	4 0- 4 6
Kents	4 3- 5 3

	per cwt. s.d. s.d.
Blacklands	3 6- 4 0
Lincolns	4 0- 5 0

Remarks.—Prices and conditions of trade are the same as last week. *Edward J. Newborn, Covent Garden and St. Pancras, October 9, 1912.*

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending October 5, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather* was at first extremely unsettled, with heavy falls of rain in many parts of Great Britain; a thunderstorm occurred at Portsmouth on Monday, and at several of the Channel stations on Tuesday. After Tuesday a gradual change took place, and in the latter half of the week the weather was mostly fair and dry. With the improved conditions sharp ground frosts occurred nightly over a wide area, and a good deal of fog and mist was experienced in places.

The *temperature* was below the average, the deficit varying from less than 2° in Scotland N. to nearly 4° in England N.E. and N.W. and Ireland S., and to 4½° in England S.W. The highest readings were observed in the earlier half of the week when the thermometer rose slightly above 60° in most of the English districts and in Ireland S., and touched 65° at Jersey. The lowest readings occurred mostly on October 4 and 5 when the sheltered thermometer fell to 25°, or less in many districts, and to 21° in England S.W. (at Llangammarch Wells). In the English Channel it did not go below 40°. The lowest grass readings reported were 16° at Birmingham, 17° at Newton Rigg, and 18° at Blackpool.

The *mean temperature of the sea* remained below the average, considerably so in most places, and was again lower than in the corresponding week of last year.

The *rainfall* amounted to less than the normal in most of the western districts, and also in Scotland N.; elsewhere there was an excess, the fall in England E. being equal to more than three times, and in England S.E. to more than four times the average. Amounts exceeding an inch were recorded in many parts of southern England on September 29, and over a large portion of Great Britain on September 30; at Wisley, Hastings and Eastbourne the total for the two days amounting to as much as 2·7 inches. Over an inch was recorded also at a few of the Channel stations on October 1.

The *bright sunshine* was generally in excess of the average, but was deficient in Scotland N. and E. Over a large portion of England the mean daily duration amounted to at least 4½ hours, or to about 40 per cent. of the possible. In Scotland N. the daily duration was less than two hours, only 17 per cent. of the possible.

THE WEATHER IN WEST HERTS.

Week ending October 9.

The sunniest week since the middle of July.—Another cold week, and the tenth in succession. On the 7th inst. the temperature in the thermometer screen exceeded the average for the time of year by 3°, making this the first unseasonably warm day since July 27, or for 72 days—more than 10 weeks. The nights have all been very cold, and on six of them the exposed thermometer showed from 8° to 18° of frost. In the last 26 years there have been only four instances in October of such a low reading as that last named, and none so early in the month. The ground is at the present time 3° colder at 2 feet deep, and 4° colder at 1 foot deep, than is seasonable. No rain at all fell during the week, but on three nights there was a measurable quantity of dew deposited on the funnel of the rain-gauge. For the last two days there has been no measurable percolation through either of the soil gauges. The sun shone on an average for 6½ hours a day, or for 3 hours a day longer than is usual at the same period in October. In fact, there was more sunshine in the past week than in any week since the middle of July, or for 12 weeks. Light airs and calms have alone prevailed. The mean amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by as much as 14 per cent. My Dahlias were killed by frost on the night preceding the 6th inst., which is 30 days earlier than the average date of their destruction in the previous 27 years, and the earliest date since October, 1888, or for 24 years.

The Summer Rainfall.

During the summer half of the present drainage year, ending September, 15 inches of rain fell, which is 1½ inches in excess of the average for the same six months in the last 56 years. The rainfall in April and July was below the average, but all the other months were wet, and August exceptionally so. *E. M., Berkhamsted, October 9, 1912.*

SCHEDULE RECEIVED.

Blackpool and Fylde Horticultural Society.—The sixteenth annual Chrysanthemum show will be held in the Winter Gardens, Blackpool, on Wednesday and Thursday, November 13 and 14. A silver Rose bowl, valued at 15 guineas, is offered in the class for a table of Orchids, arranged with foliage plants. Secretary, Mr. J. C. Bolton, 87a, Church Street, Blackpool.

DEBATING SOCIETIES.

READING GARDENERS'.—The inaugural meeting for the autumn session was held on the 23rd ult.; Mr. F. G. Drew presided. A lecture on "Common Sense in the Cultivation of the Apple" was delivered by Mr. W. Camm, gardener at Cliveden, Taplow. Mr. Camm exhibited shoots of different varieties of Apples, showing how, in some sorts, fruit buds are produced freely on the wood of the current year, whilst in others fruit buds are formed chiefly on short, stubby spurs along the sides of the unshortened shoots of the previous year. He pointed out how any severe cutting back of these shoots generally produced growth instead of fruit buds. Examples were also shown where the fruit buds are produced at the ends of short lateral shoots. Mr. Camm pointed out that the natural habit of the tree must be considered, especially its method of fruit-bud production, before any system of pruning is adopted.

STIRLING & DISTRICT HORTICULTURAL.—A meeting of this society was held on the 1st inst., Mr. Wm. Watt, Bridge of Allan, presiding. Mr. W. W. Ritchie (late of Polmaise) delivered a lecture on "Apples." The history and propagation of the Apple by seeds, cuttings, layers, suckers, grafting, and budding were described, and information given on stocks, scions, suitable soil and situation, forms of trees, and planting. The lecturer suggested that the Apple tree might be planted more frequently in public parks and pleasure grounds than it is at present; also that proprietors might encourage the planting of orchards on farms and crofts, and so help to keep people on the land.

BOLTON HORTICULTURAL.—The first meeting of the new session was held at the Spinners' Hall, Bolton, on the 3rd inst., when Mr. R. G. Waterman, County secretary for Lancaster of the Royal International Horticultural Exhibition, 1912, gave an interesting description of that great flower show. Mr. W. Holmes, gardener to J. McCartney, Esq., who was a successful exhibitor at the Show, Mr. H. Shone, treasurer, and Mr. G. Corbett, secretary of the society, also spoke as to the merits and extent of the exhibition.

CHELMSFORD & DISTRICT GARDENERS'.—The first meeting of the winter session was held in the County Laboratories on the 4th inst, when the president, Mr. E. H. Christy, occupied the chair. An exhibition of fruit was held previous to the lecture. The entries were not very numerous. Mr. Heath gained the 1st prize, Mr. Kirby the 2nd, and Mr. Overall the 3rd. After the exhibition Mr. F. J. Chittenden, director of the Royal Horticultural Laboratories at Wisley, gave a lecture on "Some Plant Diseases," asking the members to select certain diseases for him to deal with. Before treating of the diseases named by his audience Mr. Chittenden gave a brief survey of the functions of the root, stem, and leaf of a plant. Dealing with the streak disease of Sweet Peas, Mr. Chittenden said that it was caused by a fungus attacking the roots when the latter are enfeebled by overwatering and bad cultivation.

CARDIFF GARDENERS'.—The opening meeting of the 1912–13 session, held at the Queen's Hotel on the 1st inst., was well attended by the members. The chair was taken by the president, Mr. J. J. Neale. Mr. R. W. Treseder, of Messrs. Wm. Treseder, Ltd., Cardiff, gave an interesting review of the newer Roses, dealing with those introduced since 1909. About 75 vases of the newer varieties, principally H.T.'s and T.'s, were displayed by Mr. Treseder. The speaker said that Roses of the H.T. type were the most profitable, as they continue in flower from June till November. Mr. Treseder gave a comprehensive description of the newer Roses, with interesting remarks as to their merits and demerits.

CROYDON & DISTRICT HORTICULTURAL.—At the meeting of this society, held on the 1st inst., Mr. H. H. B. Shepherd, F.I.C., F.C.S., delivered a lecture on "The Use of Artificial Fertilisers for Flower, Fruit and Vegetable Culture." The forethought of Mr. Dickinson in having printed copies of the lecture to distribute amongst the audience gave the members opportunity to grasp technicalities accruing from a lecture of this description. The lecturer illustrated his remarks with lantern slides.

WARGRAVE & DISTRICT GARDENERS'.—A meeting of this association was held on the 2nd inst. Five new members were elected and splendid exhibits were staged by Mr. Richardson, of the Wargrave Plant Farm, Ltd., and by Mr. Hall, Shiplake Court Gardens. The former consisted of a collection of early-flowering Chrysanthemums of the newer varieties, and the latter of a large vase of Carnations and numerous small vases of double white Stocks. He also staged several varieties of Apples and Pears. Most of the flowers were sent to the Royal Berks. Hospital the following morning. The subject for the evening's discussion was "Rambling Roses and their Uses," introduced by Mr. W. H. Scott, of the Hermitage Gardens, Twyford.

GARDENING APPOINTMENTS.

Mr. D. Calthorpe, for the past 4 years Gardener to J. D. Crosbie, Esq., Ballyheigue Castle, Co. Kerry, as Steward and Gardener to Lt.-Col. Wm. Dugald Stuart, Dowestown, Navan, Co. Meath.

CLAY'S LONDON FERTILIZER
TRADE MARK.
Every TIN, BAG & SEAL bears this TRADE MARK—the only Guarantee of Genuineness.

"A GRAND FERTILIZER"

"The value of CLAY'S FERTILIZER needs little emphasis. It is, one may say, an old friend that has been tried and proved over and over again.... The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur gardeners are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."

NURSERYMAN AND SEEDSMAN, 20th July, 1912.

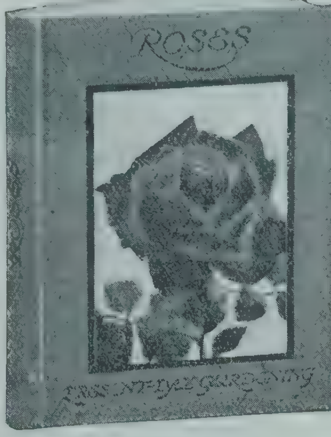
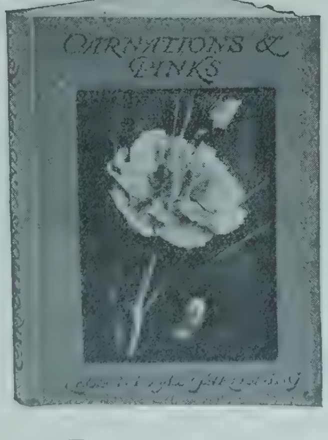
"Gardeners' Chronicle" Offices, 41, Wellington Street, Covent Garden, W.C.





Present-Day Gardening Series

1/6 Net PER VOLUME.

Edited by R. HOOPER PEARSON, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. COOK, Head Gardener to Queen Alexandra at Sandringham; JAMES DOUGLAS, V.M.H.; and J. F. M'LEOD, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By WILLIAM WATSON, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir FRED. W. MOORE, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. GROVE, F.L.S., with Preface by H. J. ELWES, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. RICKATSON DYKES, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. CURTIS, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. DARLINGTON, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

ROSES is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. JACOB, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. WILKS, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By JAMES O'BRIEN, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By WILLIAM CUTHBERTSON, J.P., and R. HOOPER PEARSON.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By HORACE J. WRIGHT, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by THOS. STEVENSON.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By ALEXANDER DEAN, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By GEORGE BUNYARD, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

REMARKS.—Home-grown Apples are not plentiful, but supplies are ample for ordinary requirements. Shipments of Apples from overseas last week consisted of 8,000 boxes of Newtown Pippin and 22,000 of Wenatchee, both choice essert varieties. There have also been received 1,000 boxes Doyenné du Comice Pears from the finest orchards in Rogue River Valley, Oregon. It is anticipated that consignments of Pears from this district will continue during the next six months. The area of cultivation comprises about 250,000 acres from the Wenatchee Valley to Oregon. The output will be about 2,000,000 cases of both Apples and Pears of a standard weight, 40lbs. to 42lbs. per case. The demand for best Grapes has shown an improvement, but inferior bunches are, as usual, very plentiful and have a poor demand. A few Melons are obtainable; English and Guernsey Figs are practically finished; Italian Figs are a full supply. Dried Figs and Dates are meeting with a good demand. Nuts are plentiful and cheap; the first consignment of Redon Chestnuts arrived this week. Fine fruits of the noted Californian Silver Prunes, also Coe's Golden Drop Plums are obtainable. Best Tomatos are scarcer; Teneriffe Tomatos are obtainable packed in bundles of four boxes, each containing about 12lbs. to 14lbs. of fruit. Tomatos are also arriving from Lisbon, Mushrooms from the Worthing district are much more plentiful, but there are none from out-of-doors. Paris Green Asparagus, Channel Island and French Beans in packets, are all obtainable. All other seasonable vegetables are a fairly good supply. *E. H. R., Covent Garden, October 16, 1912.*

New Potatos.

	per cwt. s.d. s.d.		per cwt. s.d. s.d.
Bedfords	4 3- 4 9	Lincolns	4 0- 5 0

Blacklands ...	3 9- 4 3	German	3 9- 4 3

REMARKS.—Trade remains firm; consignments are light and include a few tubers from Holland and Germany. *Edward J. Newborn, Covent Garden and St. Pancras, October 16, 1912.*

DEBATING SOCIETIES.

WIMBLEDON GARDENERS'.—The opening meeting of the thirteenth session of this society took place on the 9th inst.; the president, Mr. W. Dowdon, occupied the chair, and there were present 60 members. Mr. E. J. Allard gave a lecture on "Plant Propagation," dealing with the subject from both the practical and scientific aspects. Vegetables of excellent quality were put up by the members and prizes were awarded. The next meeting is fixed for the 23rd inst., when Messrs. Cox and Townsend, of Messrs. Sutton & Sons, Reading, will lecture on "Annuals in Pots."

READING GARDENERS'.—The second meeting of the session took place in the Abbey Hall, on Tuesday, the 8th inst. There was again a large attendance, the President (Ald. F. B. Parfitt) occupying the chair. Mr. H. C. Loader, of Erlegh Park Gardens, lectured on "The Value of Observation to the Gardener." Addressing himself particularly to the younger members of the audience, Mr. Loader strongly advised them not to neglect the cultivation of the faculty of observation. Mr. Loader exhibited a collection of vegetables, and Mr. F. Townsend, Hillside Gardens, showed a fine specimen of Woodwardia radicans. Several new members were elected.

RUDDINGTON & DISTRICT GARDENERS'.—The first meeting of this society for the session 1912–13 took place on Tuesday last, when an address on "Garden Allotments" was given by Mr. Smith, of Loughborough, before a large audience. The lecturer recommended economical management, cropping in rotation, Celery growing for deep cultivation, and the planting of a few flowers "for the wife." The Chairman stated that he considered the growing of Salads was neglected. The President, Mrs. Wray Hunt, in proposing a vote of thanks to the lecturer, agreed with him about growing flowers in allotments, for this showed he had a perception of the beauty of things, and, as Wordsworth said, when he saw the fringe of Daffodils growing round Ullswater Lake:

"My heart with pleasure fills,
And dances with the Daffodils."

She also agreed with the Chairman, as Sir Joseph Paxton said, "Cucumbers should be eaten with the sun in them." A small collection of fruit and vegetables was exhibited; also a fruit of Peasgood's Nonesuch Apple weighing 1 lb. 7 ounces.

GARDENING APPOINTMENTS.

[Correspondents are requested to ***write the names of persons and places as legibly as possible.*** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]*

Mr. G. HENLEY, for the past 25 years Gardener to SYDNEY MORRIS, Esq., Wretham Hall, Thetford, as Gardener to the same gentleman at Earlham Hall, Norwich.

Mr. A. GIBSON, for 7 years Gardener at Ardsley House, Yorkshire, and 5 years at Zeals House, Wiltshire, as Gardener to Mrs. HERBERT MORRELL, Headington Hill Hall, Oxford. (Thanks for 2s. 6d. for R.G.O.F. box.—EDS.)

Mr. W. KNILLER, for the past 20 years Gardener to Col. HADAWAY, R.A., Grenville, Godalming, Surrey, and formerly Gardener to W. F. FAVELL, Esq., Down Place, Guildford, as Gardener and Forester to EDITH Countess of WINCHILSEA and NOTTINGHAM, Haverholme Priory, Sleaford, Lincoln. (Thanks for donation of 2s. for the R.G.O.F. box.—EDS.)

Mr. A. M'CRONE, Gardener to the Misses SETON WIGHTMAN, Courance, Lockerbie, Dumfriesshire, as Gardener to —. WEIR, Esq., Over Courance, Lockerbie.

Mr. H. WORKMAN, for nearly 4 years Foreman at Luscombe Castle, Dawlish, Devonshire, as Gardener to H. N. LLOYD, Esq., Chaddleworth House, Wantage, Berks.

Mr. FRANK LUCAS, General Foreman under Mr. FRANCE, Knockbrea, as Gardener to W. MAITLAND HERIOT, Esq., Whitecroft, Ruthwell, N.B. (Thanks for 2s. 6d. sent for R.G.O.F.—EDS.)

Mr. C. H. RYDE, for more than 8 years Gardener to G. GOODALL, Esq., J.P., Pine Ridge, Farnham, Surrey, and recently for 5 months Gardener to Gen. Sir WYKEHAM LEIGH PEMBERTON, K.C.B., Abbots Leigh, Haywards Heath, as Gardener to Mrs. HURST, Horsham Park, Horsham, Sussex.

Mr. W. FOOTE, for the past 18 months Gardener to Mrs. TENNENT, Adsdean, Chichester, as Gardener to E. H. CARTWRIGHT, Esq., Myskyns, Ticehurst, Sussex.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the Gardeners' Chronicle."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

PRIVATE.

Shanghai Municipal Council.

SHANGHAI POLICE FORCE.

POLICE RECRUITS are now required for the above force; applicants must be unmarried, about 22 to 26 years of age, of good physique, with sound teeth, about 5 ft. 10 in. in height, chest fully expanded about 38 inches, and able to procure excellent references as to character. Salary commences at taels 70 per month, equal to about £9; there are extra allowances for knowledge of modern languages, also for plain clothes men in the detective branch. Salaries rise steadily on promotion up to, in the case of Chief Inspectors, about taels 300 per month, equal to about £40. The value of the tael at present rate of exchange is about 2s. 9d., but it is liable to fluctuation. Agreement.—For three years with free passage to Shanghai, liberal superannuation scheme, free quarters, and bonus of £5 for outfit. The climate of Shanghai is much the same as in England, though both hotter and colder. Police work in Shanghai is the same kind of work as is done by any town police in the larger towns of the United Kingdom. The work in Shanghai is in no way like Colonial mounted work as done in the Colonies. Every facility is given in spare hours for enjoying all kinds of sports, such as cricket, football, cycling, &c. In addition men of good character may take a three weeks holiday per annum for the purposes of shooting, &c. Applicants for particulars must state their age, height, chest measurements, condition of teeth, particulars of trade or calling and references before terms of service and application forms will be issued to them. Apply by letter, giving these particulars in envelope marked "Police," to Messrs. JOHN POOK & CO., Agents for the Municipal Council of Shanghai, 63, Leadenhall Street, London, E.C.

WANTED, a good GARDENER (SINGLE-HANDED); Greenhouses, Stove, Wall Fruit, &c.; strong and active; age 35 to 40; married, no family preferred; churchman; £1 and cottage.—TURBUTT, Hinchley Wood, Ashbourne, Derbyshire.

Cambridge University Press

Journal of Genetics
A periodical for original research in Heredity, Variation and allied subjects. Edited by W. BATESON, M.A., F.R.S., Director of the John Innes Horticultural Institution, and R. C. PUNNETT, M.A., Professor of Biology in the University of Cambridge. The Journal will from time to time contain articles summarising the existing state of knowledge in various branches of Genetics. Adequate illustration is provided, and, where the subject matter demands it, free use is made of coloured plates. A volume, consisting of 4 parts, will appear, as far as possible, annually. The subscription price, payable in advance, is 30*s. net* per volume (post free); the price of separate parts will be 10*s. net* each. The current volume is Vol. II.

Biometrika
A journal for the statistical study of biological problems. Founded by W. F. R. WELDON, FRANCIS GALTON, and KARL PEARSON. Edited by KARL PEARSON. *Biometrika* appears about four times a year. A volume containing about 500 pages, with plates and tables, is issued annually. The subscription price, payable in advance, is 30*s. net* per volume (post free); single numbers, 10*s. net*. The current volume is Vol. IX.

The Journal of Agricultural Science
Edited by Professor R. H. BIFFEN, M.A., Cambridge, A. D. HALL, M.A., F.R.S., Rothamsted, and Professor T. B. WOOD, M.A., Cambridge. *The Journal of Agricultural Science* is issued in quarterly parts of about 100 pages, with plates and figures, four parts constituting a volume. The subscription price, payable in advance, is 15*s. net* per volume (post free); single numbers 5*s. net*. The current volume is Vol. V.

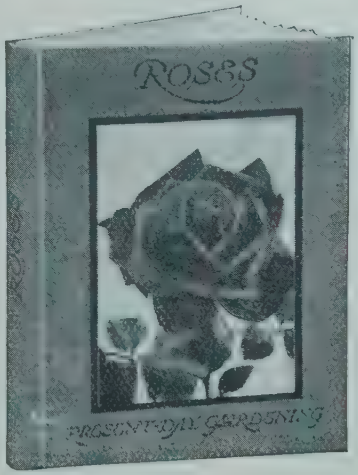
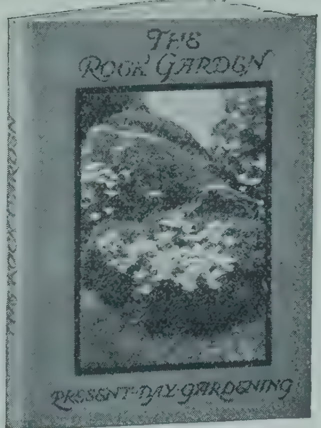
Present-Day Gardening Series





1/6 Net PER VOLUME.

Edited by R. HOOPER PEARSON, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. COOK, Head Gardener to Queen Alexandra at Sandringham; JAMES DOUGLAS, V.M.H.; and J. F. M'LEOD, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By WILLIAM WATSON, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir FRED. W. MOORE, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. GROVE, F.L.S., with Preface by H. J. ELWES, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. RICKATSON DYKES, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. CURTIS, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. DARLINGTON, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

ROSES is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. JACOB, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. WILKS, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By JAMES O'BRIEN, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By WILLIAM CUTHBERTSON, J.P., and R. HOOPER PEARSON.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By HORACE J. WRIGHT, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by THOS. STEVENSON.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By ALEXANDER DEAN, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By GEORGE BUNYARD, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society.

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

A New Catalogue of Garden Books will be sent free on application.

BELL & BIEBERSTEDT'S

Noveltics of Sterling Merit for 1913.

New Pea—Warriston Wonder.

This splendid New Pea is from a cross between "The Bell" and "Gradus." Height five feet. A Main Crop with strong haulm and dark green foliage and pods borne in pairs, with ten to eleven immense Peas of exquisite flavour. We consider this the heaviest cropping Pea in cultivation, and can well recommend it for the Exhibition Table. We are sure it will become a great favourite with market gardeners. In sealed Packets (¼ pint each), **2/6** Retail. Stock limited.

New Pea—Bell's Premier.

This magnificent New Pea is a cross between "Gradus" and "The Bell." Height 5½ feet. A late second early with strong haulm and of medium green foliage, and pods borne in pairs, with nine to eleven large Peas of splendid flavour. It will become a grand Exhibition variety and can be well recommended for market growers. In sealed Packets (½ pint each), **2/6** Retail. Stock limited.

New Broad Beans—The Cropper.

This is a cross between "Aquadulce" and "Bunyard's Exhibition," and its robust habit and heavy cropping qualities are unrivalled for Exhibition purposes. The pods are well packed, containing eight to nine beans of most excellent flavour. Price on application.

Electros of the above, size and price on application per return of post.

Scotch Saved Seeds.

MARKETS.

COVENT GARDEN, *October 23.*

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—Supplies of English Apples have increased and the fruits are meeting with a firmer demand. Good samples of the following varieties of Pears from home growers have been on sale this week: Conference, Pitmaston Duchess, and Doyenné du Comice. Supplies of French Pears show a decrease. Shipments of fruit from Wenatchee and California amounted to about 70,000 cases of dessert Apples and Doyenné du Comice Pears, the bulk consisting principally of Apples. Twelve hundred cases of Peaches have arrived from Ontario. Black varieties of Grapes continue a heavy supply. Bunches of Muscat of Alexandria and Canon Hall Muscat of the best grades are selling better. Almeria Grapes in barrels are arriving in a good keeping condition, and are being purchased for storing until later in the season. Of Plums, a few Berkshire and Switzen Prunes are still obtainable. Californian Plums have arrived in an excellent condition. Blackberries are still obtainable. Nuts are plentiful all round; English Walnuts are keeping very badly. Supplies of Melons and Figs are finishing. Cultivated Mushrooms show a considerable increase in supplies, and their prices have depreciated in consequence. English Tomatos have been a better supply, and the fruits have sold freely. A few Tomatos are still arriving from the Channel Islands. Teneriffe Tomatos are now to hand. Dwarf Beans are arriving from Guernsey, Madeira, and France. English Scarlet Runner Beans are practically finished. Paris Green Asparagus is arriving in excellent condition, in bundles of about 40 heads each. *E. H. R., Covent Garden, October 23, 1912.*

New Potatos.

	per cwt. s.d. s.d.		per bag. s.d. s.d.
Bedfords	4 0- 4 9	Dutch	3 3- 4 0
Kents	4 6- 5 3	Belgian	3 6- 3 9
Blacklands	3 9- 4 3	German	3 9- 4 3
Lincolns	4 0- 5 0		

REMARKS.—Trade is still very steady, and prices are about the same as last week. A large quantity of Dutch, Belgian and German Potatos are arriving this week. *Edward J. Newborn, Covent Garden and St. Pancras, October 23, 1912.*

GARDENING APPOINTMENTS.

[Correspondents are requested to ***write the names of persons and places as legibly as possible.*** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]*

Mr. A. HARDY, for the past 7 years Foreman at Ribston Hall Gardens, Wetherby, as Gardener to the Hon. E. H. DAWNAY, West Heslerton Hall, York.

Mr. T. HOBBS, for the past 5 years and 9 months Gardener to VIVIAN PHILLIPPS, Esq., and formerly for over four years gardener to RUPERT KETTLE, Esq., Crofton Court, Orpington, Kent, as Gardener to F. HARRILD, Esq., Sherlies, Orpington, Kent. (Thanks for 2s. 6d. received for R.G.O.F. box.—EDS.)

Mr. R. J. WILLIS, as Gardener to E. G. MONRO, Esq., Highfield, Bushey Heath, Hertfordshire.

Mr. E. C. ALLNUTT, Foreman at Wilton Park, Beaconsfield, Bucks., as Gardener to Major FOOT, White Hill, Berkhamsted, Herts. (Thanks for 1s. for R.G.O.F. box.—EDS.)

Mr. F. SIVELL, for nearly 4 years Gardener to Capt. CHAMBERLAYNE, Chichester, Gipsy Hill, Pinhoe, Devon, as Gardener to Mrs. R. P. MORGAN, Brynhyfryd, Neath, South Wales. (Thanks for donation to the R.G.O.F. box.—EDS.)

Mr. E. NETLEY, until recently for 18 months Second Gardener at Broadstone, Forest Row, Sussex, as Gardener to Miss ROBERTS, Davenies Barn, Beaconsfield, Bucks.

Mr. JOHN W. HATTON, late Foreman at Bromham House, Bedford, and previously at Wrest Park, Ampthill, Beds., as Gardener to J. W. COOPER, Esq., J.P., Dashwood, Gravesend, Kent.

Mr. A. BECKETT, recently Gardener to Major STAPYLTON-Myton Hall, Yorkshire, and previously Foreman to Sir EDWARD COATES, Bart., M.P., Helperby Hall, Yorkshire, as Gardener to J. DYMOND, Esq., Burntwood Hall, Barnsley. (Thanks for donation to the R.G.O.F. box.—EDS.)

Mr. LEWIS SMITH, for 11 years Gardener to ROBERT FELLOWES, Esq., Shotesham Park, Norwich, as Gardener to MALDWIN DRUMMOND, Esq., Cadland, Southampton.

SCHEDULES RECEIVED.

The Huntingdonshire Daffodil and Spring Flower Society's exhibition, to be held on Thursday, April 17, 1913. Hon. secretary, Miss Linton, Stirtloe House, Buckden, Huntingdon.

Nottingham and Notts. Chrysanthemum Society's exhibition, to be held on November 8 and 9, in the Mechanics, Large Hall, Nottingham. Secretaries: Mr. G. E. Skelhorn, 26, Sneinton Road, Nottingham, and Mr. H. Atkin, 27 Ashfield Road, Nottingham.

Hertford Horticultural Society's twenty-first exhibition of Chrysanthemums, fruit and vegetables, to be held in the Corn Exchange and Market, on Wednesday and Thursday, November 6 and 7.

Hull and East Riding Chrysanthemum Society.—The twenty-first Chrysanthemum show will be held in the New City Hall, Victoria Square, Hull, on Wednesday and Thursday, November 20 and 21. Secretary, Mr. James Dixon, 2, County Buildings, Hull.

Dover Horticultural Society.—The autumn show of Chrysanthemums and fruit will be held in the Town Hall, Dover, on Wednesday, November 6. Secretary, Mr. C. P. Tomlin, 65, Folkestone Road, Dover.

CATALOGUES RECEIVED.

FOREIGN.

SLUIS & GROOT, Enkhuizen, Holland—Vegetable, Flower, and Agricultural Seeds.

M. HERB, Via Trivio, 24, Naples, Italy—New Plants.

(We are retaining this column week by week to take our readers on "flying visits" to our new Exhibition Warehouses and Testing Grounds at Raynes Park, Wimbledon, which are always open to the public.
JAMES CARTER & CO.,
The King's Seedsmen.)

I.—IF IT WERE A THOUSAND MILES AWAY!

If Raynes Park were a thousand miles' pilgrimage, all London would eagerly flock there to see what is undoubtedly a sight without parallel in the industrial kingdom. But being, as it is, within twenty-five minutes' motor run of Piccadilly Circus and four minutes' walk of Raynes' Park Station on the L. & S.W. Railway, it shares the fate of Westminster Abbey and the Tower, which tens of thousands of London people live their lives without seeing.

* * * *

So the Visitors' Book in the spacious marble Entrance Hall tells us. Here are pages of visitors from places so far apart as Burma and Belgium, Kansas City and Johannesburg, Sweden and Sydney, Germany and the Azores, Budapest and Canada, sparsely leavened with visitors from Mayfair.

* * * *

It was a new idea deliberately to break away from the stereotyped form of ugly, depressing, multi-storied warehouse and to build a great bungalow workplace on novel and hygienic lines, where the workpeople could go about their duties in cheerfulness and comfort. As the endless stream of trains speed by on the adjacent railroad, the eyes of the passengers are focused by day upon this strikingly original industrial palace with its broad carriage-drive and beautiful gardens, and by night upon the two-thousand-four-hundred-light electric sign announcing the Exhibition Warehouses and Testing Grounds of Carter's Tested Seeds.

(Next week: "Five Minutes with the Bulbs.")

THE WEATHER.

The Following Summary Record of the weather throughout the British Islands, for the week ending October 19, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather*.—In Ireland and the north and northwest of Britain rain was experienced almost daily over a large area, but in the south and east of the Kingdom rain was less frequent, and several days were fair to bright.

The *temperature* was above the average generally, but only equal to it in England E., and slightly below it in England S.E. In Ireland the excess amounted to more than 2½°. The highest of the maxima occurred at most stations on the 13th and 14th, and ranged from 65° in the Midland Counties and the English Channel to 59° in Scotland N. and W. The lowest of the minima, which were generally registered either on the 15th or later in the week, varied from 25° in Scotland E., 26° in England S.W. and 29° in England S.E., to 36° in England, N.E., and to 43° in the English Channel. The lowest grass readings were 20° at Crathes, 21° at Birmingham, 22° at Hampstead, Balmoral, and West Linton, and 24° at Kew and Newton Rigg. The ground thermometers remained below the average, both at the depth of 1 foot and 4 feet.

The *mean temperature of the sea.*—At every station except Kirkwall, Aberdeen and Cleggan the water was colder than the average, but in several localities it was warmer than during the corresponding week of last year; so much as 4° at Lerwick and Cleggan. The values ranged from 56° at Plymouth and Salcombe to less than 50° on many parts of the Northern coasts, and to 47 degrees at Berwick.

The *rainfall* was less than the average in the greater part of England, and also in Scotland E. and Ireland S., but exceeded it in Scotland N. and W., England N.W., and Ireland N. Falls of an inch or more were recorded on the 13th at Castleberg, Fort William, and Crieff, and on the 15th at many places in Scotland; 1·3 in. at Rothesay and 1·7 in. at Fort William. At a few places in the Midlands and Eastern and Southern England rain fell on only 2 days, and at Dungeness on only 1 day.

The *bright sunshine* was less than the normal generally, but more in England E. and S.E. and the English Channel In this last district the mean daily duration was 4.9 hours and in England S.E. 4·6 hours. In Scotland it was less than 2 hours. The percentage of the possible duration ranged from 46 in the English Channel and 44 in England S.E. to 14 in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending October 23.

The three coldest days as yet this month —During the fortnight ending the 20th, the days were nearly all more or less warm for the time of year, but on the 21st there occurred a fall in temperature. In fact, the last three days have remained very cold—the coldest as yet this month. The night temperatures have been mostly very low since the month began, and are still low for October. The ground is at the present time 3° colder at 2 feet deep, and 4° colder at 1 foot deep, than is seasonable. Rain fell on five days during the past week, and to the total depth of half an inch. For the first time for a fortnight there has been a little percolation through both of the soil gauges. The sun shone on an average for 3¾ hours a day, which is about three-quarters of an hour a day longer than is usual in the middle of October. Light airs and calms as a rule prevailed, but on one day the wind was higher than it had previously been this month, but even then the mean velocity for the windiest hour only amounted to 12 miles The average amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by four per cent. *E. M., Berkhamsted, October 23, 1912.*

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS'.—A meeting of this association was held on the 10th inst., when Mr. Thoday presided over a moderate attendance of the members. Mr. Garnish gave a lecture on "Chrysanthemums for Cutting."

CROYDON AND DISTRICT HORTICULTURAL.—The meeting of this society on Tuesday, 15th inst., was well attended. A bottled fruit competition took place amongst four exhibitors; the first prize was won by Mr. F. J. Hainge, and the second by Mr. H. Boshier. Mr. H. Alderman, of Morden Hall Gardens, Mitcham, read a paper on "Gardening and Gardeners—Past and Present."

BATH GARDENERS'.—The opening meeting for the new session was held on 14th inst. A lecture on "The Apple," was delivered by Mr. Boulter, a member of the Midsomer Norton Gardeners' Society. Mr. Boulter gave details on the preparation of the ground and the planting of the trees. He also dealt with insect pests, and showed how Apple trees may be kept clean and healthy.

WARGRAVE AND DISTRICT GARDENERS'.—A meeting of the members of the above association took place on the 16th inst., when the Hon. Secretary, Mr. H. Coleby, gave a lecture, entitled "Certain Physical Phenomena Bearing on the Work of the Garden," illustrated with diagrams, pictures and experiments. The following were the points dwelt upon: The pressure of the air and the principle of the barometer; osmosis; the cold nature of water-logged soils; the use of lime in the soil and how to prove its presence there; and capillarity in soils. The Wargrave Plant Farm exhibited a collection of Michaelmas Daisies, not for competition. The flowers were forawarded to the Royal Berkshire Hospital the following morning. Four new members were elected.

HALESWORTH & DISTRICT GARDENERS'.—A general meeting of this new society was held on the 3rd inst., when the committee was elected. The Rev. A. R. Upster was appointed President, Mr. T. Simpson, Henham Gardens, Chairman, Mr. C. Goodwin Treasurer, and Mr. C Rudrum Secretary.

CARDIFF GARDENERS'.—The fortnightly meeting of this society was held on the 15th inst.; Mr. A. H. Cossom presiding over a good attendance of the members. Mr. H. Harriss, gardener at "Ty Gwyn," Lisvane, delivered a paper on "Sweet Peas for Exhibition and House Decoration." Mr. Harriss stated that in 1902 there were but 90 varieties classified, whereas in 1912 there were 190, not one of which was in the 1902 list. Mr. Harriss advocated autumn sowing, which results in earlier flowering and consequently an earlier seed harvest. He also advised deep trenching and the planting of some other crop before the Sweet Peas. Mr. Harriss staged several vases of clean, long stemmed flowers of the leading varieties, those of "John Ingman" being especially good.

DEVON AND EXETER GARDENERS'.—The annual meeting of this association was held at Exeter, on the 16th inst., under the chairmanship of Mr. G. Merrett. The Hon. Secretary and Treasurer (Mr. W. Mackay) read the annual report which was adopted. Mr. Trehawke Kekewich was re-elected president, and the Vice-Presidents were also re-elected. Mr. W. Mackay was re-elected hon. secretary and treasurer.

PANGBOURNE & DISTRICT GARDENERS'.—A meeting of this association was held on Wednesday, the 16th inst., in the small hall of the Constitutional Club. Mr. H. E. Du Cams Norris presided. A paper on the "Sweet Pea for Home and Exhibition" was read by Mr. A. Waring. Holme Lea, Goring-on-Thames. The preparation of the ground, seed sowing, disbudding the plants, diseases, and the best methods of cutting and packing the blooms for exhibition were all ably dealt with by the lecturer.

WATFORD HORTICULTURAL.—At a meeting of this association held on the 11th inst., a lecture on "Rock and Wild Gardening" was given by Mr. F. E. Newman. The lecture was illustrated by lantern slides. Later there was a discussion on the Viola. In a competition open to amateur members for Potatos, Mr. W. Sear was placed 1st, and Mr. J. Ford 2nd. Mr. W. Webb was awarded the 1st prize in competition for Apples and Pears.

CHELMSFORD & DISTRICT GARDENERS'.—The second meeting of the winter session was held in the Institute of Agriculture, Chelmsford, on the 18th inst; the president, Mr. E. W. Christy, presided, and about 60 members were present. Mr. Montague Allwood gave a lecture on "Perpetual-flowering Carnations." Mr. Allwood advised selecting the cuttings from the centres of half-ripened shoots, as cuttings taken at the base were too slow of growth, whilst those near to the flower were too weak. The cuttings, said Mr. Allwood, should be inserted in sand and not loam, as the latter held too much water. A compost of loam well opened with sand, and containing one-fifth its bulk of stable manure, together with a little lime rubble (if the soil is deficient in lime), would be suitable for potting the rooted cuttings. The method of stopping was fully explained; it was advised to stop fairly hard into the mature wood.

PRIVATE.

Shanghai Municipal Council.

SHANGHAI POLICE FORCE.

POLICE RECRUITS are now required for the above force; applicants must be unmarried, about 22 to 26 years of age, of good physique, with sound teeth, about 5 ft. 10 in. in height, chest fully expanded about 38 inches, and able to procure excellent references as to character. Salary commences at taels 70 per month, equal to about £9; there are extra allowances for knowledge of modern languages, also for plain clothes men in the detective branch. Salaries rise steadily on promotion up to, in the case of Chief Inspectors, about taels 300 per month, equal to about £40. The value of the tael at present rate of exchange is about 2s. 9d., but it is liable to fluctuation. Agreement.—For three years with free passage to Shanghai, liberal superannuation scheme, free quarters, and bonus of £5 for outfit. The climate of Shanghai is much the same as in England, though both hotter and colder. Police work in Shanghai is the same kind of work as is done by any town police in the larger towns of the United Kingdom. The work in Shanghai is in no way like Colonial mounted work as done in the Colonies. Every facility is given in spare hours for enjoying all kinds of sports, such as cricket, football, cycling, &c. In addition men of good character may take a three weeks holiday per annum for the purposes of shooting, &c. Applicants for particulars must state their age, height, chest measurements, condition of teeth, particulars of trade or calling and references before terms of service and application forms will be issued to them. Apply by letter, giving these particulars in envelope marked "Police," to Messrs. JOHN POOK & CO., Agents for the Municipal Council of Shanghai, 63, Leadenhall Street, London, E.C.

WANTED, GARDENER (Head of two); must be competent man, who thoroughly understands Greenhouses and frames, also Flowers, Vegetables, and Fruit; cottage not supplied.—Write full particulars, with wages required and copies of testimonials, to GIBBINS, Garthmor, Neath, Glamorganshire.

WANTED.—Can a Gentleman or Head Gardener recommend a thoroughly good GARDENER (Head Working) with foreman, labourer, and three boys under him; must have a thorough knowledge of all kinds of Flowers and Glasshouses, Hardy Borders, Rockery?—Apply by letter only to DUCHESS OF WELLINGTON, Ewhurst Park, Basingstoke.

WANTED, GARDENER (married without family) to live in small lodge; total abstainer; one other man kept; must understand Carnations and Rose growing; not much glass; must have had good experience, and have good testimonials from last employer.—Address, Miss E., care of W. H. Smith & Son, The Library, Weston Hill, Upper Norwood, S.E.

WANTED, smart, active MAN, married, to take LEAD in Flower and Kitchen Gardens, Pleasure Grounds, &c.; must be well up to his work; wages 16s. per week and house.—Apply, stating age, experience, with copies of testimonials, DOW, Gardens, Amport St. Mary, Andover.

WANTED, good experienced MAN for Rock Garden, Herbaceous Borders, Roses, and Cut Flower Stuff; to fill up time Inside or Out as required.—Fullest particulars to F. W. CHILVERS, Sherrington Manor, Berwick, Sussex.

New Hybrid Winter Flowering Begonias.

AWARDED THREE GOLD MEDALS.

Indispensable for producing a brilliant display of bloom during the dark days of Winter.

SPECIAL AUTUMN OFFER OF STRONG VIGOROUS PLANTS IN 5 INCH POTS IN BUD. IMMEDIATE DELIVERY.

Superb New Varieties.

Each.

Altrincham Pink, A.M., R.H.S., Dec. 1911. ... ... **10/6**

Bright pink double flowers of Camellia form, 3 inches across, in upright sprays, wonderfully free; handsome bronze green foliage.

Ex. *Gardeners' Chronicle.*—"**The best double-flowered variety** of this type of Begonia yet exhibited."
Ex. *Gardeners' Magazine.*—"**Of excellent habit,** blooms with great freedom."
Ex. *The Garden.*—"**Very charming**; of model growth and very compact."
Ex. *Journal of Horticulture.*—"**A fine addition** to the Winter Flowering class, very double, of a rich rosy pink."

Clibrans' Perfection, a fascinating colour **10/6**

Brilliant rosy red double flowers, 3 to 3½ inches in diameter, in elegant sprays; in colour, form and habit it is superb. The foliage, of a dark bronze green, still further enhances the exquisite beauty of the flowers. A "Premier" variety in every way.

Each.

Duchess of Westminster, of supreme beauty ... **10/6**

Clear soft pink, double, 3 inches across; a glorious flower, particularly fine under artificial light; free growing and free blooming. In colour, there is nothing to equal this variety. The flowers, carried in upright sprays, possess a beauty and fascination that cannot be described.

Progress, a magnificent flower **5/-**

Outer petals salmon pink, inner petals orange, perfectly double, 2 inches across, in upright sprays; a distinct departure in colour, quite different from the pink and carmine shades of the earlier raised varieties. In our glasshouses and at the Shows it is always a centre of attraction.

Orders should be booked at once.
Immediate delivery.

General Collection.

Each.

Bank Hall Beauty - - **2/6**
Salmon red, semi-double, 2½ to 3 inches across, in long elegant sprays, handsome foliage; free and robust; a lovely variety. **24**/- per doz.

Beauty of Hale - - - - **2/6**
Salmon, suffused rose, double, 2½ to 3 inches across, in handsome arching sprays; dark handsome foliage. **24**/- per doz.

Bowdon Beauty - - **1/3, 1/6**
Bright rose pink, double, 2 to 2½ inches across, with great freedom; ideal for decorative and cutting purposes; lasting in full beauty for a long period. **12**/- and **15**/- per doz.

Clibrans' Pink, A.M., R.H.S. - **3/6**
Bright pink, double, 3 inches across, in drooping sprays; free, lovely; the dark handsome foliage serves to intensify the brilliant flowers. **36**/- per doz.

Each.

Emily Clibran - - - - **2/6**
Light salmon, flushed orange; a beautiful double flower, 2½ to 3 inches across. Unusually free; handsome glossy dark bronze green foliage; a glorious variety of exceptional charm. **24**/- per doz.

Ensign, A.M., R.H.S. - **1/3, 1/6**
Light carmine, toned scarlet, semi-double; fine, a free grower and free bloomer. **12**/- and **15**/- per doz.

John Heal, F.C.C., R.H.S. **1/3, 1/6**
Bright rose carmine, 1½ to 2 inches in diam., in loose racemes; free, dwarf. **12**/- and **15**/- per doz.

Julius, A.M., R.H.S. - **1/3, 1/6**
Delicate rose pink and white, 2 to 2½ inches diameter. **12**/- and **15**/- per doz.

Miss Clibran, A.M., R.H.S. - **5/-**
Rich blush pink, double, 3 inches in diam., distinct and handsome; grand; Ex. *Gardeners' Chronicle*: "The flowers are double, rich pink in colour, and very freely produced." **54**/- per doz.

Each.

Mrs. Clibran - - - - - **3/6**
Soft pink, a beautifully clear and distinct shade, double, 3½ inches across; remarkably fine, in elegant arching sprays; good grower; a superb variety in every way. **36**/- per doz.

Mrs. Heal, A.M., R.H.S. - **1/3, 1/6**
Brilliant rose carmine, toned scarlet, 3 in. across, with great freedom; fine, effective and very beautiful. **12**/- and **15**/- per doz.

Mrs. N. F. Barnes - - - **3/6**
Bright crushed strawberry, with a suffusion of orange, double, 3 inches in diameter, in pretty drooping sprays, of exceptional charm, quite distinct. **36**/- per doz.

Success - - - - - **1/6**
Rosy crimson, with a suffusion of purple, semi-double, 2½ inches across. **15**/- per doz.

Winter Glow - - - **1/3, 1/6**
Bright fiery red, double, in upright sprays, totally distinct; compact and free. **12**/- and **15**/- per doz.

Clibrans' "Lorraine" Type Begonias.

ALL IN 5 INCH POTS. GOOD BUSHY PLANTS. IMMEDIATE DELIVERY.

Each.

Agatha, A.M., R.H.S. - **1/3, 1/6**
Resembles *Gloire de Lorraine*, whilst the habit is more compact. **12**/- and **15**/- per doz.

Amabilis (new) - - - **1/6**
A new vigorous growing variety, with bold handsome leaves and large rosy pink flowers, in handsome spikes; free growing and free blooming, very fine. **15**/- per doz.

Gloire de Sceaux - - **1/3, 1/6**
The leaves are of a rich bronze colour with crimson reverse; the flowers, on tall spikes are rosy pink; vigorous grower. **12**/- and **15**/- per doz.

Masterpiece, A.M., R.H.S. 1/- 1/3 1/6
Somewhat similar to *Gloire de Lorraine*, but stronger and more upright in growth, with larger flowers of richer colour. **10/6**, **12**/- and **15**/- per doz.

Each.

Mrs. Leo de Rothschild, A.M., R.H.S. - **1/-, 1/3, 1/6**
An improved form of *Gloire de Lorraine*, with larger flowers; a superb variety. **10/6** **12**/- and **15**/- per doz.

Patrie (new) - - **1/3, 1/6**
A very beautiful variety, the flowers, rose-pink, suffused salmon red, are entirely distinct from all other varieties and remain in full beauty for many weeks; the foliage is rich dark bronze green, strikingly handsome. **12**/- and **15**/- per doz.

President Taft (new) - - **1/6**
A vigorous free growing variety, of a rosy-pink colour; raised in America where it has received many awards and is largely grown; very free and good in every way. **15**/- doz.

Each

Rochfordi (new) - - - **1/6**
The nearest approach to a "red" Lorraine the colour of the unopened buds is particularly fine; very charming and beautiful. **15**/- per doz.

The King - - **1/-, 1/3, 1/6**
A stronger and more vigorous form of *Gloire de Lorraine*; more upright in habit, and producing larger flowers. **10/6**, **12**/- and **15**/- per doz.

Turnford Hall, A.M., R.H.S. **1/-, 1/3, 1/6**
A superb variety, flowers large, white, slightly shaded with apple blossom pink; vigorous, remarkably profuse. **10/6**, **12**/- and **15**/- per doz.

Send your Order to-day. Immediate or deferred delivery.

THE OLD ROSE GARDENS,
COLCHESTER.

(We are retaining this column week by week to take our readers on "flying visits" to our new Exhibition Warehouses and Testing Grounds at Raynes Park, Wimbledon, which are always open to the public.
JAMES CARTER & CO.,
The King's Seedsmen.)

2.—FIVE MINUTES WITH THE BULBS.

Bulbs by the billion.

Bulbs representing practically every hardy flowering variety that exists.

Sent out from Raynes Park by the single bulb, or by tens of thousands.

Last year's order for bulbs for the various Palace Gardens of his Majesty the King, the Royal Parks, and the L.C.C. Gardens amounted to 66,000 Hyacinths, 171,000 Narcissus bulbs, 170,000 Tulips, and 116,000 Crocuses.

Only by paying a visit to Raynes Park can one gain any idea of the fascination of bulb cultivation. Innumerable little stories might be told as wonderful as that of the Lily of the Valley crowns, which spend from six to nine months in the freezing chambers, and are brought out in solid lumps of ice, to spring into the purest of blooms within three or four weeks.

Here, at Raynes Park, one may purchase a bulb for a five-pound-note, or a thousand for a guinea—and every bulb carries an insurance policy in the actual trials to be seen at our Trial Grounds in the spring.

We recently paid £76 for 20 Narcissus bulbs. The world-renowned King Alfred Daffodil, the bulbs of which are now marketed at 2s. each, was sold in its first year at several guineas each.

Like most other things, bulbs may be had at all prices; but only good bulbs from a house of prestige repay their cost in the abundant realisation of long months of anticipation. It is no use *wishing* one had paid a little more when spring-time brings its disappointments.

Next Week: "Indoor Gardening."

PRIVATE.

H. DYSON wishes to Thank all who replied to him, and to state the Place is now Filled.

MR. ROGERS, Hinton Admiral, begs to say JOURNEYMAN'S place is now filled.

Shanghai Municipal Council.

SHANGHAI POLICE FORCE.

POLICE RECRUITS are now required for the above force; applicants must be unmarried, about 22 to 26 years of age, of good physique, with sound teeth, about 5 ft. 10 in. in height, chest fully expanded about 38 inches, and able to procure excellent references as to character. Salary commences at taels 70 per month, equal to about £9; there are extra allowances for knowledge of modern languages, also for plain clothes men in the detective branch. Salaries rise steadily on promotion up to, in the case of Chief Inspectors, about taels 300 per month, equal to about £40. The value of the tael at present rate of exchange is about 2s. 9d., but it is liable to fluctuation. Agreement.—For three years with free passage to Shanghai, liberal superannuation scheme, free quarters, and bonus of £5 for outfit. The climate of Shanghai is much the same as in England, though both hotter and colder. Police work in Shanghai is the same kind of work as is done by any town police in the larger towns of the United Kingdom. The work in Shanghai is in no way like Colonial mounted work as done in the Colonies. Every facility is given in spare hours for enjoying all kinds of sports, such as cricket, football, cycling, &c. In addition men of good character may take a three weeks holiday per annum for the purposes of shooting, &c. Applicants for particulars must state their age, height, chest measurements, condition of teeth, particulars of trade or calling and references before terms of service and application forms will be issued to them. Apply by letter, giving these particulars in envelope marked "Police," to Messrs. JOHN POOK & CO., Agents for the Municipal Council of Shanghai, 63, Leadenhall Street, London, E.C.

WANTED, GARDENER (HEAD WORKING, six kept); near East Grinstead, Sussex; must have thorough all-round Garden experience, knowledge in carrying out alterations, planting, keeping accurate accounts, &c.; age 35 to 40; married, without family; comfortable cottage, fire, light, and vegetables.—Apply, giving full particulars as to past experience, age, wages required, and (copy) testimonials, to H. A., Box 2, 41, Wellington Street, Covent Garden, W.C.

TENDERS.

Administrative County of London.

SUPPLY OF STORES AND EXECUTION OF GENERAL MAINTENANCE CONTRACTS.

THE LONDON COUNTY COUNCIL invites applications from persons and firms, and particularly manufacturers, to have their names placed on the lists of persons and firms from whom the Council from time to time invites tenders for the supply of the various kinds of stores required in connection with the different services of the Council, and for the execution of general maintenance contracts in connection with such services. Applications must be made on the official form, which contains particulars of the classes of goods required and of maintenance contracts entered into, the standard conditions of contract, and the references, &c., required. This form may be obtained on application to the Clerk of the London County Council, Spring Gardens, S.W.

LAURENCE GOMME,
Clerk of the London County Council.

Spring Gardens, S.W.
30th October, 1912.

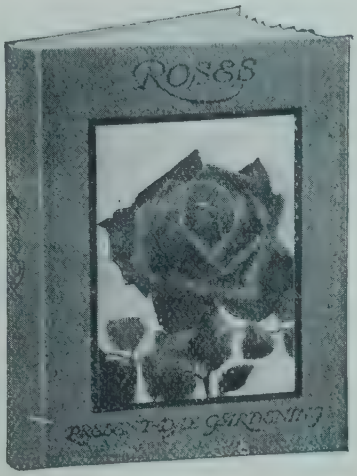
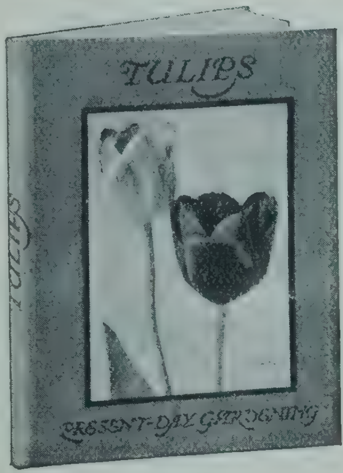
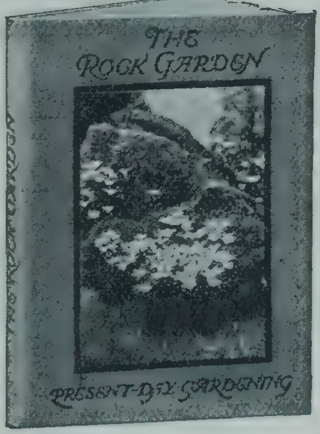
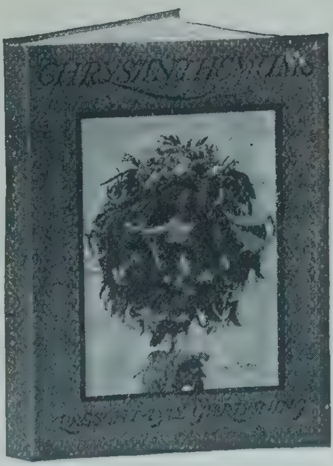
Present-Day Gardening Series









1/6 Net PER VOLUME.

Edited by R. HOOPER PEARSON, Managing Editor, "Gardeners' Chronicle."

EACH VOLUME IS WRITTEN BY AN EXPERT.

ILLUSTRATED WITH EIGHT PLATES REPRODUCED FROM COLOUR PHOTOGRAPHS.

"Everyone who loves his garden should make a point of getting the whole series illustrating 'Present-Day Gardening.'"—*The Country Home.*

CARNATIONS AND PINKS. By T. H. COOK, Head Gardener to Queen Alexandra at Sandringham; JAMES DOUGLAS, V.M.H.; and J. F. M'LEOD, Head Gardener to Mr. J. Pierpont Morgan.

"The authors of the book—for there are three—are among the best-known men in the floricultural world to-day, each a master hand in the subject with which he deals."—*Gardening Illustrated.*

RHODODENDRONS AND AZALEAS. (*The first popular volume published on this subject.*) By WILLIAM WATSON, A.L.S., Curator of the Royal Botanic Gardens, Kew, with Preface by Sir FRED. W. MOORE, M.A., A.L.S., V.M.H.

"The author, Mr. Watson, has a thorough knowledge of the subject, and has done much to develop the popular taste for rhododendrons, and he supplies here all the necessary hints for their successful culture."—*Westminster Gazette.*

LILIES. By A. GROVE, F.L.S., with Preface by H. J. ELWES, F.R.S.

"The book itself, though short, is packed with his knowledge very concisely and simply conveyed. It is also illustrated with eight coloured plates of a much higher quality than we expect in a popular gardening book."—*Times.*

IRISES. By W. RICKATSON DYKES, M.A.

"Mr. Dykes, as Professor Bayley Balfour remarks in his preface, is the successor to Sir Michael Foster in knowledge of the Iris; and in this book he has very skilfully condensed and selected his knowledge for the use of the ordinary gardener."—*The Times.*

ANNUALS: HARDY & HALF-HARDY. By C. H. CURTIS, Hon. Sec. of the National Sweet Pea Society.

"The coloured plates first strike the eye with their brilliance and purity of colour, but the letterpress is the thing."—*Evening Standard & St. James' Gazette.*

ROSES (double volume). By H. R. DARLINGTON, Vice-President of the National Rose Society.

"The work on 'Roses' by Mr. H. R. Darlington admirably maintains the high standard set by previous authors in this useful series of gardening books. The coloured illustrations are some of the best examples of colour photography hitherto published in this series."—*Nature.*

ROSES is a double volume at **2/6** net; cloth gilt, gilt top, **3/6** net.

DAFFODILS. By the Rev. J. JACOB, Secretary of the Midland Daffodil Society, with Preface by the Rev. W. WILKS, M.A., Secretary of the Royal Horticultural Society.

"The two volumes now under notice are 'Daffodils,' by the Rev. Joseph Jacob, than whom there is no better authority and who is surpassed by few as a pleasant writer on gardening matters."
—*Birmingham Daily Post.*

ORCHIDS. By JAMES O'BRIEN, V.M.H., Secretary of the Orchid Committee of the Royal Horticultural Society.

"As a grower Mr. O'Brien was a champion when many of us were infants, and he is to-day one of the first authorities on all that appertains to garden orchids."—*Field.*

PANSIES, VIOLAS, AND VIOLETS. By WILLIAM CUTHBERTSON, J.P., and R. HOOPER PEARSON.

"No safer guide to methods of culture, the selection of varieties, and historical details, could possibly be desired."—*Gardeners' Magazine.*

SWEET PEAS. By HORACE J. WRIGHT, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition" by THOS. STEVENSON.

"We find real delight in reading what these two well-known authorities have to say about flowers which are dear to every gardener and the charm of thousands of gardens."—*Field.*

ROOT AND STEM VEGETABLES. By ALEXANDER DEAN, V.M.H., Chairman of the National Vegetable Society.

"The book is admirably arranged, and will be a valuable companion to growers of vegetables for home use or for sale, and even for exhibition, a branch which has a chapter specially devoted to it."
—*Field.*

APPLES AND PEARS. By GEORGE BUNYARD, V.M.H., Chairman of Fruit and Vegetable Committee of the Royal Horticultural Society

"......How these Present-Day Gardening books are offered at 1/6 we cannot tell; we are glad to have them so cheaply, and they are splendid value for the money."—*Journal of Horticulture.*

Each Volume 1/10 post free (ROSES 2/10 & 3/10) to be obtained from The PUBLISHER, GARDENERS' CHRONICLE, 41, Wellington Street, Covent Garden, London, W.C.

A New Catalogue of Garden Books will be sent free on application.

CLIBRANS

By Appointment. By Appointment.

New Hybrid Winter Flowering Begonias.

AWARDED THREE GOLD MEDALS.

Indispensable for producing a brilliant display of bloom during the dark days of Winter.

SPECIAL OFFER OF STRONG VIGOROUS PLANTS IN 5 INCH POTS IN BUD. IMMEDIATE DELIVERY.

Superb New Varieties.

Each.

Altrincham Pink, A.M., R.H.S., Dec. 1911 ... ... **10/6**
Bright pink double flowers of Camellia form, 3 inches across, in upright sprays, wonderfully free; handsome bronze green foliage.

Ex. *Gardeners' Chronicle.*—"**The best double-flowered variety** of this type of Begonia yet exhibited."
Ex. *Gardeners' Magazine.*—"**Of excellent habit,** blooms with great freedom."
Ex. *The Garden.*—"**Very charming**; of model growth and very compact."
Ex. *Journal of Horticulture.*—"**A fine addition** to the Winter Flowering class, very double, of a rich rosy pink."

Clibrans' Perfection, a fascinating colour **10/6**
Brilliant rosy red double flowers, 3 to 3½ inches in diameter, in elegant sprays; in colour, form and habit it is superb. The foliage, of a dark bronze green, still further enhances the exquisite beauty of the flowers. A "Premier" variety in every way

Duchess of Westminster, of supreme beauty **10/6**
Clear soft pink, double, 3 inches across; a glorious flower, particularly fine under artificial light; free growing and free blooming. In colour, there is nothing to equal this variety. The flowers, carried in upright sprays, possess a beauty and fascination that cannot be described.

Progress, a magnificent flower **5/-**
Outer petals salmon pink, inner petals orange, perfectly double, 2 inches across, in upright sprays; a distinct departure in colour, quite different from the pink and carmine shades of the earlier raised varieties. In our glasshouses and at the Shows it is always a centre of attraction.

General Collection.

Each.

Bank Hall Beauty - - **2/6**
Salmon red, semi-double, 2½ to 3 inches across, in long elegant sprays, handsome foliage; free and robust · a lovely variety. **24/-** per doz.

Beauty of Hale - - - **2/6**
Salmon, suffused rose, double, 2½ to 3 inches across, in handsome arching sprays; dark handsome foliage. **24/-** per doz.

Bowdon Beauty - - **1/3, 1/6**
Bright rose pink, double, 2 to 2½ inches across, with great freedom; ideal for decorative and cutting purposes; lasting in full beauty for a long period. **12/-** and **15/-** per doz.

Clibrans' Pink, A.M., R.H.S. - **3/6**
Bright pink, double, 3 inches across, in drooping sprays; free, lovely; the dark handsome foliage serves to intensify the brilliant flowers. **36/-** per doz.

Emily Clibran - - - **2/6**
Light salmon, flushed orange; a beautiful double flower, 2½ to 3 inches across. Unusually free; handsome glossy dark bronze green foliage; a glorious variety of exceptional charm. **24/-** per doz.

Ensign, A.M., R.H.S. - **1/3, 1/6**
Light carmine, toned scarlet, semi-double; fine, a free grower and free bloomer. **12/-** and **15/-** per doz.

John Heal, F.C.C., R.H.S. **1/3, 1/6**
Bright rose carmine, 1½ to 2 inches in diam., in loose racemes; free, dwarf. **12/-** and **15/-** per doz.

Each.

Julius, A.M., R.H.S. - **1/3, 1/6**
Delicate rose pink and white, 2 to 2½ inches diameter. **12/-** and **15/-** per doz.

Miss Clibran, A.M., R.H.S. - **5/-**
Rich blush pink, double, 3 inches in diam., distinct and handsome; grand; Ex. *Gardeners' Chronicle*: "The flowers are double, rich pink in colour, and very freely produced." **54/-** per doz.

Mrs. Clibran - - - - **3/6**
Soft pink, a beautifully clear and distinct shade, double, 3½ inches across; remarkably fine, in elegant arching sprays; good grower; a superb variety in every way. **36/-** per doz.

Mrs. Heal, A.M., R.H.S. - **1/3, 1/6**
Brilliant rose carmine, toned scarlet, 3 in. across, with great freedom; fine, effective and very beautiful. **12/-** and **15/-** per doz.

Mrs. N. F. Barnes - - - **3/6**
Bright crushed strawberry, with a suffusion of orange, double, 3 inches in diameter, in pretty drooping sprays, of exceptional charm, quite distinct. **36/-** per doz.

Success - - - - **1/6**
Rosy crimson, with a suffusion of purple, semi-double, 2½ inches across. **15/-** per doz.

Winter Glow - - - **1/3, 1/6**
Bright fiery red, double, in upright sprays, totally distinct; compact and free. **12/-** and **15/-** per doz.

MARKETS.

COVENT GARDEN, *November 6.*

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.]

REMARKS.—There is no change to report in the English Apple trade; the supply is still good. Large consignments of Apples are arriving from Nova Scotia, York Imperial being probably the best variety. There are also fairly large supplies of Apples from California and Washington, U.S.A.; the principal varieties from the latter district are Grime's Golden, Jonathan, Wine Sap, and Spitzenberg—which is much appreciated for its excellent colour and flavour. Californian Pears are arriving in good condition, and meet with a steady trade. Doyenné du Comice Pears from home growers, Jersey and the Colonies, are very plentiful, and meet with a steady demand. All varieties of Black Grapes are still very plentiful, but Canon Hall Muscat and Muscat of Alexandria will now be getting scarcer; selected samples are already in demand. Varieties of Californian Plums, including Coe's Golden Drop and Silver Prunes, are obtainable in limited quantities. Supplies of English Walnuts are shortening, but French Grenoble Walnuts are very plentiful, as also are Cobnuts and Chestnuts. There still continues to be a good supply of English Tomatos, the colour and general condition of the fruits, considering the time of the year, being excellent, Teneriffe Tomatos are an increasing supply. Mushrooms are exceptionally plentiful for the time of the year, especially from the Worthing district. The commoner vegetables are abundant. *E. H. R., Covent Garden, November 6, 1912.*

Potatos.

	per cwt. s.d. s.d.
Bedfords	4 0- 4 6
Kents	4 0- 5 0
Blacklands	3 6- 4 0
Lincolns	3 6- 5 0

	per bag. s.d. s.d.
Dutch	2 9- 3 6
Belgian	3 0- 3 9
German	3 6 4 0

REMARKS.—Trade is very steady; best English Potatos are in demand, but inferior tubers are a slow trade. The market is glutted with Foreign Potatos and prices for these are lower. *Edward J. Newborn, Covent Garden and St. Pancras November 7, 1912.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending November 6.

A change to warmer weather.—The weather was cold in the early part of the week, but the last three days have been warm for the time of year. The change in the night temperature was very sudden, for after four very cold nights when the exposed thermometer registered from 13° to 15° of frost the same thermometer on the following night only fell to 38°, making that night 21° warmer than the night before. The ground is at the present time 2° colder, at 2 feet deep, and 1° colder at 1 foot deep, than is seasonable. Rain fell on four days to the total depth of half-an-inch. During the week 2½ gallons of rainwater have come through the bare soil percolation gauge, and 3 gallons through that on which short grass is growing. The sun shone on an average for 2¾ hours a day, or for half-an-hour a day longer than is usual at the same period in November. On one day the sun was shining brightly for six hours, but on two other days no sunshine at all was recorded. On the first day of the week the wind was rather high, but since then light airs and calms have alone prevailed. The mean amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by 7 per cent.

OCTOBER.

Very cold and calm, and rather dry, with a good record of sunshine.—This was, with one exception, the coldest October for 16 years. The days were, as a rule, only slightly below the average in temperature, but the nights were as much as 5° colder than is usual in October, and colder than in any October since 1888, or for 24 years. On the warmest day the temperature in the thermometer screen rose only to 63°, and on the coldest night the exposed thermometer registered 13° of frost. Both of these extreme readings are very low for the month, the highest maximum being, with one exception (1905), the lowest for 16 years, and the lowest minimum reading, with one exception (1905), the lowest for 17 years. Rain fell on 13 days, to the total depth of 2½ inches, which is half an inch below the average for October. Nearly the whole of the rainfall was deposited on the first day and last six days of the month, for very little fell during the intervening 24 days. The sun shone on an average for 3¾ hours a day, which is three-quarters of an hour a day longer than the average duration for the month—making this the brightest October since 1900, or for 12 years. Taken as a whole, this was a calm October, and in no hour did the mean velocity of the wind exceed 15 miles. The average amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 6 per cent. In fact, the air at that hour was drier than in any October for 24 years. *E. M., Berkhamsted, November 6, 1912.*

DEBATING SOCIETIES.

READING GARDENERS'.—The usual fortnightly meeting of this association was held on Monday, the 21st ult. Mr. F. G. Drew, chairman of the committee, gave a lecture on "Fruit Tree Stocks." The lecturer gave his experience as to the comparative values of various stocks on different kinds of soil. Trees in different stages of growth worked on Apple and Pear stocks were exhibited, and also specimens of the stocks themselves, showing their respective root systems and characteristic growth.

BRISTOL AND DISTRICT GARDENERS'.—A meeting of this society was held on the 31st ult. Dr. Shingleton Smith presided over a large attendance of the members. Mr. Powell, a member of the Reading Gardeners' Society, gave a practical demonstration in table and room decoration with flowers.

TRADE NOTICES.

ROYAL WARRANT.

Messrs. F. Scott and Sons, Horticultural Specialists, Woodside, London, have been granted a Royal Warrant of Appointment to His Majesty King George V.

CHANGE OF ADDRESS.

THE Standard Manufacturing Company, late of 37, Hillcrest Crescent, Leeds, has removed to Rowditch, Derby.

GARDENING APPOINTMENTS.

[Correspondents are requested to ***write the names of persons and places as legibly as possible.*** *No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]*

Mr. Wm. Hy. Stephens, late of Stanshawes Court, Gloucestershire, and formerly at Prescot House, Worcestershire, as Gardener to Judge Amphlett, Wychbold Hall, Droitwich, Worcestershire.

Mr. Herbert Stonebridge, for the past 7½ years Gardener to J. H. Cooper, Esq., Dashwood, Gravesend, as Gardener to W. R. Preston, Esq., Seend Park, near Melksham, Wiltshire. (Thanks for 2s. which has been placed in the R.G.O.F. box.—Eds.)

Mr. R. Dawe, late Gardener to Major Wait, R.E., as Gardener to W. A. Platt, Esq., Alverbank, Stokes Bay, Alverstoke, Gosport, Hampshire.

Mr. J. A. Peskett, for nearly 10 years Gardener to Gerald W. Bond, Esq., Creech Grange, Wareham, Dorset, as Gardener to Heath Harrison, Esq., Le Court, Liss, Hampshire.

Mr. T. Garrett, for upwards of 2 years general Foreman at Longleat Gardens, Warminster, and previously Foreman at Ammerdown Park, Radstock, as Gardener to Sir W. J. Hollams, Dene Park, Tonbridge.

Mr. Sidney Myers, for 10 years with Messrs. Smith Bros., Uitenhage, Cape Provence, previously with Messrs. H. B. May & Sons, London, and at Castle Ashby, Northampton, as Curator of the Municipal Park, Somerset East, Cape Provence. (Thanks for donation of 1s. for the R.G.O.F. box.—Eds.)

Mr. William F. Rowles, for the past year Gardener to Lord Ninian Crichton-Stuart, Falkland Palace, Fifeshire, and previously for 5 years Foreman in the gardens of the Marquis of Bristol, Ickworth, Bury St. Edmunds, as Gardener to H. Hoare, Esq., Ellisfield Manor, Basingstoke, Hampshire.

Mr. H. W. Bromley, for the past 18 years Gardener to Sir Frank Forbes Adam, Mere Old Hall, Knutsford, as Gardener to R. Dempster, Esq., Vale Royal, Hartford, Cheshire. (Thanks for 2s. for R.G.O.F. box.—Eds.)

(We are retaining this column week by week to take our readers on "flying visits" to our new Exhibition Warehouses and Testing Grounds at Raynes Park, Wimbledon, which are always open to the public.
JAMES CARTER & CO.,
The King's Seedsmen.)

BLOSSOMS FROM CHRISTMAS TO EASTER.

Were the founders of our old-established city firms to come back to life and pay a visit to the scenes of their enterprises, what of all the latter-day changes would most surprise them?

Possibly the marvels of the telephone; possibly the clattering typewriting machines or the wonders of the electric appliances; but, most probable of all, the "office-gardens"—the gay bowls and shapely glasses of delicately-scented Hyacinths, nodding Daffodils and graceful Narcissus, presenting so daring a relief to the sombre atmosphere of the offices.

* * * *

And if it be true that the spirits of our ancestors attend our Yuletide festivities, what must they think to see, in the depth of winter, windows, odd corners, and feast-laden tables beautifully decorated by a brave show of Lilies of the Valley and Roman Hyacinths?

* * * *

For winter is no longer blossomless. Be the world outside never so barren, unpromising or heavy with gloom, we may yet have the golden glory of the Daffodil, the waxen beauty of the Hyacinth, and the graceful charm of the Narcissus throughout the dreary months to Easter!

* * * *

Twenty-five years ago Messrs. James Carter & Co. received from their China agents the first parcel of the Chinese Sacred Lily. This happy chance was the birth of Indoor Gardening, the Chinese Sacred Lilies doing so well in drainless bowls that experiments were undertaken, and to-day we have a list of Daffodils and Narcissus which give a home-beautifying hobby which, every autumn, finds its captivated followers vieing with each other to possess the most beautiful display of blossoms.

* * * *

An almost inexhaustible variety of artistic bowls and glasses for indoor gardening attracts the admiring visitor to Raynes Park, and courteous members of the staff give him in a nutshell the whole of the fascinating story of indoor gardening.

(Next week Daffodils.)

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the Gardeners' Chronicle."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

HYBRID WINTER FLOWERING BEGONIAS,

is cultivated in our Glasshouses.

By Appointment. By Appointment.

AWARDED FIVE GOLD MEDALS.

Superb New Varieties.

	Each.
Altrincham Pink, A.M., R.H.S., Dec. 1911 ... ... Bright pink double flowers of Camellia form, 3 inches across, in upright sprays, wonderfully free; handsome bronze green foliage. Ex. *Gardeners' Chronicle.*—"**The best double-flowered variety** of this type of Begonia yet exhibited." Ex. *Gardeners' Magazine.*—"**Of excellent habit,** blooms with great freedom." Ex. *The Garden.*—"**Very charming**; of model growth and very compact." Ex. *Journal of Horticulture.*—"**A fine addition** to the Winter Flowering class, very double, of a rich rosy pink."	**10/6**
Clibrans' Perfection, a fascinating colour ... ... Brilliant rosy red double flowers, 3 to 3½ inches in diameter, in elegant sprays; in colour, form and habit it is superb. The foliage, of a dark bronze green, still further enhances the exquisite beauty of the flowers. A "Premier" variety in every way.	**10/6**
Duchess of Westminster, of supreme beauty ... ... Clear soft pink, double, 3 inches across; a glorious flower, particularly fine under artificial light; free growing and free blooming. In colour, there is nothing to equal this variety. The flowers, carried in upright sprays, possess a beauty and fascination that cannot be described.	**10/6**

General Collection.

	Each.
Bank Hall Beauty - - Salmon red, semi-double, 2½ to 3 inches across, in long elegant sprays, handsome foliage; free and robust; a lovely variety. **24/-** per doz.	**2/6**
Beauty of Hale - - - Salmon, suffused rose, double, 2½ to 3 inches across, in handsome arching sprays; dark handsome foliage. **24/-** per doz.	**2/6**
Bowdon Beauty - - Bright rose pink, double, 2 to 2½ inches across, with great freedom; ideal for decorative and cutting purposes; lasting in full beauty for a long period. **12/-** and **15/-** per doz.	**1/3, 1/6**
Clibrans' Pink, A.M., R.H.S. - Bright pink, double, 3 inches across, in drooping sprays; free, lovely; the dark handsome foliage serves to intensify the brilliant flowers. **36/-** per doz.	**3/6**
Emily Clibran - - - Light salmon, flushed orange; a beautiful double flower, 2½ to 3 inches across. Unusually free; handsome glossy dark bronze green foliage; a glorious variety of exceptional charm. **24/-** per doz.	**2/6**
Ensign, A.M., R.H.S. - Light carmine, toned scarlet, semi-double; fine, a free grower and free bloomer. **12/-** and **15/-** per doz.	**1/3, 1/6**
John Heal, F.C.C., R.H.S. Bright rose carmine, 1½ to 2 inches in diam., in loose racemes; free, dwarf. **12/-** and **15/-** per doz.	**1/3, 1/6**

	Each.
Julius, A.M., R.H.S. - Delicate rose pink and white, 2 to 2½ inches diameter. **12/-** and **15/-** per doz.	**1/3, 1/6**
Miss Clibran, A.M., R.H.S. - Rich blush pink, double, 3 inches in diam., distinct and handsome; grand; Ex. *Gardeners' Chronicle*: "The flowers are double, rich pink in colour, and very freely produced." **54/-** per doz.	**5/-**
Mrs. Clibran - - - - Soft pink, a beautifully clear and distinct shade, double, 3½ inches across; remarkably fine, in elegant arching sprays; good grower; a superb variety in every way. **36/-** per doz.	**3/6**
Mrs. Heal, A.M., R.H.S. - Brilliant rose carmine, toned scarlet, 3 in. across, with great freedom; fine, effective and very beautiful. **12/-** and **15/-** per doz.	**1/3, 1/6**
Mrs. N. F. Barnes - - - Bright crushed strawberry, with a suffusion of orange, double, 3 inches in diameter, in pretty drooping sprays, of exceptional charm, quite distinct. **36/-** per doz.	**3/6**
Success - - - - Rosy crimson, with a suffusion of purple, semi-double, 2½ inches across. **15/-** per doz.	**1/6**
Winter Glow - - - Bright fiery red, double, in upright sprays, totally distinct; compact and free. **12/-** and **15/-** per doz.	**1/3, 1/6**

THE Popularity of "XL ALL" Specialities increases every year. All gardeners proclaim that nothing equals these celebrated preparations. "XL ALL" NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant, both Liquid and Cake. "XL ALL" NICOTINE INSECTICIDE WASH for Syringing, Dipping and Dressing Fruit Trees and Plants; Mealy Bug, Scale, etc., cannot exist where this is used. "XL ALL" INSECTICIDE WASH B (*sine* Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are:—Richards' "XL ALL" WINTER WASH for dormant Fruit Trees and Bushes. "XL ALL" GARDEN FERTILIZER, "XL ALL" LAWN SAND, etc. Don't forget to ask your Nurseryman or Seedsman for my small pink list.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

SUTTON'S INIMITABLE BEDDING TULIPS (Single). Will flower simultaneously, the lovely colouring producing a magnificent display. White, Rose-pink, Yellow, Orange, Scarlet, Pink and White.
Each per doz., 1s. 9d.; per 100, 10s. 6d.

Mr. H. LILEY, Gardener to R. B. Jowitt, Esq., writes:—"For brilliant colouring, substance, uniformity of height, time of flowering, and lasting properties, your Inimitable Tulips are the best I have ever seen."

Kelway's Pæonies.

NOW IS THE TIME TO PLANT Pæonies —the best time in the whole year. No garden is complete without the new Pæonies. Kelway's recommend the following Collection as being representative of their celebrated varieties. They will give great satisfaction, and be a credit to any garden:—Agenoria, Amalthea, Czarina, Duc de Wellington, Formosa, Lottie Collins, Nycletius, Princess Maude, Splendida, Tessa, The Lancaster, Zephyrus, 36s. the dozen, good plants, true to name; immediate delivery. Carriage and packing free for remittance with order (mentioning this advertisement).

From ——, Esq., ——, Salcombe. "It may interest you to hear that one of the reasons that made me buy this property was the well-stocked garden and the glorious display of Pæonies, for which it has the great reputation in this neighbourhood, and which came from you. They are truly glorious. They exceed all expectations."

KELWAY & SON, The Royal Horticulturists, Langport, Somerset.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"A most valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the GARDENERS' CHRONICLE."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*

AT HEADQUARTERS.

Visitor to Raynes Park: You must need to stock a good many of these bright orange seed-pockets; I seem to have known them all my life.

Manager: We have used them for the past sixty years. There are one-and-a-quarter millions stored in this room. ... Here are seventy-five thousand embossed green leather-board postal boxes.

Visitor: They look strong enough to withstand the most vigorous assaults of the postal authorities!

Manager: And they need be—for some of the seeds they carry are most costly. The Holborn Prize Primula seed, for example, is worth as much as £50 an ounce.

Visitor: These are all packed by hand, of course?

Manager: Yes; but if you will come this way I will show you the filling machines with which we pack the regular illustrated pockets used for export. When I tell you that we occasionally get huge orders, you will see that hand-packing would be out of the question.

Visitor: These are the pockets you refer to?

Manager: Yes; there are close upon five millions of them on hand, but these will barely carry us along till next season. You will see the pockets carry educational matter which is of the greatest value to our customers in all parts of the globe. ... This is one of the filling machines.

Visitor: What a marvellous machine! Really, it is almost human! I wonder what some of your customers would say if they saw their packets being filled with it?

Manager: The machine interests everybody. It especially attracted a Cabinet Minister who paid us a visit a little while since. ... You would be surprised, I daresay, if you knew how much wrapping paper we use.

Visitor: Ten tons at least, I should say.

Manager: Nearer twenty-two tons! Two-and-a-half tons of tin case-lining, and sixty-seven tons of casing boards, as well as enough packing-twine to reach from Raynes Park, via Southampton, to New York

Handbook of Tropical Gardening and Planting.

By H. F. MACMILLAN, Curator of the Royal Botanic Gardens, Peradeniya, Ceylon.

A fine record of progress in tropical agriculture and horticulture, and testifies not only to the fertility of Ceylon, but also to the resource of the author. The home-keeping reader will find much that is of interest in its rich and varied contents.

Nearly 200 illustrations. Post free, **12/-**

THE PUBLISHER,

"Gardeners' Chronicle" Offices, 41, Wellington St., Covent Garden, London, W.C.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects." —*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns." —*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf." —*The Observer.*

"A most valuable work for the amateur gardener." —*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult." —*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year." —*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners." —*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests." —*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed." —*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation." —*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book." —*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the GARDENERS' CHRONICLE." —*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service." —*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money." —*Cork Constitution.*

Sale by Auction. **By Order of SANDER & SONS.** **DECEMBER 13th, 1912.**

Old Pacho Odontoglossum Alexandræ.

We instructed our Mr. Louis Forget to go to Pacho, to the old collecting areas of our Mr. Oswald Kerbach, to find, if he could, some of the true Pacho varieties of **Odontoglossum Alexandræ**, and he has succeeded in finding a few, and this small consignment has just reached us, in magnificent condition. Plants could not be finer.

Also 50 lots of **Cattleya Dowiana Aurea**, fine well-leaved plants, including many specimens.

Messrs. PROTHEROE & MORRIS will Sell the above by Auction, at their CENTRAL SALE ROOMS, **67 & 68, Cheapside, London, E.C.**

MISCELLANEOUS.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects." —*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns." —*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf." —*The Observer.*

"A most valuable work for the amateur gardener." —*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult." —*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year." —*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners." —*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests." —*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed." —*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation." —*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book." —*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the GARDENERS' CHRONICLE." —*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service." —*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money." —*Cork Constitution.*

KING'S ACRE
NURSERIES LTD.,
HEREFORD.

FROM HEADQUARTERS.

It is only to be expected that anything which has been steadily growing for seventy-five years should now have reached a high state of maturity.

It was in 1836 that the late Mr. James Carter published his first annual catalogue, which consisted of a single sheet, from 237, High Holborn. Ever since then the yearly catalogues have been steadily growing larger and larger, in a manner worthy of the seeds themselves, until now it has become the most wonderful and the largest catalogue devoted exclusively to seeds in the world.

About December 9th the new Carter's Annual, entitled "Garden and Lawn," will be published. It is of nearly two pounds postal weight, and carries close upon 300 pages on art paper! It is profusely illustrated, chiefly with photographs taken by the firm's own staff of photographers, and completed in the Studios on the premises; but there are also photos. from all parts of the world.

The coveted volume opens fittingly with a page showing His Majesty King George inspecting our Japanese Garden Exhibit at the International Exhibition at Chelsea. The firm hold the Royal Warrant of His Majesty King George, Her Majesty Queen Alexandra, H.I.M. The German Emperor, also eleven other appointments to other Royal and Reigning Houses, which we believe to be a record in the industrial world.

An Art Supplement illustrates the unique Raynes Park establishment, justly regarded as one of the most perfect examples of what industrial buildings should be, and always open to visitors. We then have pages on the fascinating story of Testing, followed by beautiful pictures of Vegetables and Flowers.

The Annual is a masterpiece of printing, such as one would naturally expect from printers of the standing of Messrs. McCorquodale, one of the largest firms of printers in the Kingdom, whose resources and appliances for the printing of works of this nature are well known.

It is interesting to know that the requirements of the book include nearly 100 tons of art paper, printing ink, and type, a large number of latest printing machines, about 80 miles of binders' thread, 350 engraved plates in duplicate, 100,000 embossed stamps; while 25 pair-horse parcel-post vans are required for the conveyance of the work, when completed, to the General Post Office.

NEWS FROM HEADQUARTERS.

EFFICIENCY.

The continued prosperity and progression of the British Empire depend on the efficiency of all departments and individuals on whom the responsibility resolves. The diplomacy of ambassadors and the integrity of over-sea consuls is as important as the maintenance of a strong fleet, capable of immediate mobilisation, or a powerful army ready to take the field at a moment's notice. It is only by possessing departments and individuals of the highest efficiency that our heritage can be upheld.

In business, similar conditions are essential, and only those houses who adapt their systems to modern requirements can hope for continued prosperity. The up-to-date firm must be willing to scrap existing plant and methods immediately they have decided that they no longer spell complete efficiency.

We were the pioneers of "Tested Seeds," and during each decade our experts have been constantly working to introduce new methods of testing, selection, grading and hybridization, until at the present time, nearly 100 years after our business was established, we possess machinery, apparatus, trial grounds and facilities which are second to none. Come and see them whenever you can spare the time.

Every department is trained to a high standard of efficiency, controlled by men of proved ability and discernment. Our resources are at your command and we undertake to cater for every horticultural necessity, from supplying one packet of Virginia Stock to 50,000 bushels of peas, and from filling a window box to laying out a thousand-acre golf course.

A DELIGHTFUL GIFT BOOK.

Beautiful Flowers

And How to Grow Them.

By Horace J. Wright and Walter P. Wright.

Illustrated with 100 plates in full colours from paintings by Beatrice Parsons, Eleanor Fortescue Brickdale, Anna Lee-Merritt, Hugh L. Norris, Lilian Stannard, Margaret Waterfield, A. F. Muckley, and F. E. James.

Complete in two vols., cloth, One Guinea net the set.

"Were it only for the sake of the illustrations, we should heartily commend this volume to lovers of garden-colour. But it is more than a picture book of beautiful flowers, for it tells how to grow them."—DAILY CHRONICLE.

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which nave been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur gardening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of gardening operations, so the Guide should prove of great assistance to all who are interested in any branch of the subject. The advice is conveyed in a concise, practical, and simple manner, and the value of the text is greatly enhanced by the number of excellent illustrations and diagrams which accompany it. Every amateur can be assured of finding something to interest and instruct in a perusal of the pages of this work, and the 'Calendar' should not fail to find a prominent place on his bookshelf."
—*The Observer.*

"**A most valuable work for the amateur gardener.**"
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the GARDENERS' CHRONICLE."
—*The Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"**It is excellent value for the money.**"
—*Cork Constitution.*

CHRYSANTHEMUM NOVELTIES.

WE would draw your attention to the proved merit of the varieties we introduced last Season, notable amongst which are—**Bob Pulling, Miss A. E. Roope, J. Surry, Francis Rowe, Miss Elsie Davis, Mrs. J. G. Day and W. H. Head**; all these have been awarded F.C.C'S and are recognised by all who have seen them as being some of the finest raised. With this FACT before you, it will be readily understood the keen pleasure we experience in stating that we have, if possible, a still better selection for 1913; every variety we know to be thoroughly good and distinct; six of them have been awarded F.C.C'S, and we have no doubt the remainder would have had the same honour given them, but for the fact that stock was limited and not sufficient flowers available; we, therefore, with every confidence, strongly recommend them to Exhibitors, knowing they will be valuable helps to winning prizes, and add to our reputation as raisers and introducers of sterling Novelties. **H. J. JONES' NURSERIES, LTD., Ryecroft, Lewisham.** We shall supply the following Jap varieties early in February: Mrs. H. J. Jones, Joan Stratton, Master Rex, Miss Ethel Surry, Miss Joan Miller, Miss Mary C. Smith, Miss May Fox, Mr. A. E. Usher, Mrs. Alec. H. Dence, Mrs. Alice Thorpe, Mrs. Corbet Woodall, Mrs. J. B. Riding, Mrs. R. C. Pulling, Mrs. W. T. Smith.

New Incurved Varieties: Don Q., Gordon Newton Wells, Miss Thelma Hartmann, Queen Mab, S. J. Dove.

Descriptive List of these Novelties free on application.

GREAT SUCCESS OF WEBBS' SEEDS

Hundreds of Gold, etc., Medals, Cups, and Champion Prize ng Exhibitions of the Kingdom, including 15 Gold Medals a , and many other Honours in 1912, have been awarded to the Prod of Webbs' Vegetable and Flower Seeds.

Section of Webbs' Exhibit at the Royal International Horticultural Exhibition, London, 1912, awarded Large Gold Medal and Diploma of Honour for Excellence of Flowering Plants Raised from Seed.

Extract from the "London Daily Standard," May 23rd, 1912.

Messrs. Webb & Sons, the King's Seedsmen, have selections of Cineraria stellata, Schizanthus, Gloxinia, Calceolarias, Primula Obconica, Cineraria, etc., of exceptional merit. Their striking exhibit is set out in the form of enormous banks and groups of brilliantly coloured bloom, tastefully furnished with palms, ferns, and lovely lawn grass which H.M. The King examined critically.

DEBATING SOCIETIES.

RUDDINGTON AND DISTRICT GARDENERS'.—At the meeting of this society, held on the 17th inst., Dr Goodwin, Principal of the Kingston Agricultural College, delivered a lecture on "Soil Bacteria." He pointed ou that the soil is filled with living organisms, of which bacteria rank first in point of numbers. These bacteria may classified, from the gardener's point of view, into fo groups: (1) Those which assist the gardener by bringin the nitrogen in natural manures into the condition in whi alone it is available as plant food (these friendly bacteria are favoured by all the ordinary garden operations of digging hoeing, raking, &c.); (2) Those which act on nitrogenou plant foods and change them into a condition unsuitable fo plant food (these are the bacterial foes of the gardener and they develop best under the conditions brought abou by bad tillage); (3) Bacteria which live free in the soil an convert the free nitrogen of the air into a form useful t plants as food; and (4) Those which bring about the sam change but live in union with the roots of leguminous crop These last two groups are important to the gardener, sin they manufacture, at small cost, a most valuable manure

"R.H.S." Diary for 1913.

A handy pocket diary, for Amateur and Professional Gardeners. Contains many hints on Cultivation, a "Daily Wants" Dictionary, and other valuable information.

NEWS FROM HEADQUARTERS.

WHAT THE SEED-BUYER OWES TO THE BIG SEED HOUSES.

When revelling in the delights of your garden, have you ever given a thought to what you owe to the big seed houses?

Did you know that a house like James Carter and Co. spends from £3,000 to £4,000 a year on arresting seed-degeneration, and on progressive researches?

In all cultivated plant life, there is a perpetual tendency to revert to the original type. If, for example, you reproduce from seeds of your own growing, you will find your plants grow weaker and weaker each successive season.

That is exactly what would happen universally, but for the big seed houses. Only a visit to the great Exhibition Warehouses of James Carter and Co., at Raynes Park, can give you any adequate idea of the extraordinary measures taken—not merely to check the cultivated plant from running back to its original form, but to force it to a higher and yet higher form of development. Costly laboratories are maintained, where scientists pursue their horticultural researches all the year round, and the magnificent buildings are surrounded by extensive trial grounds where the plants undergo their final stages of examination.

After all, there is little difference between the development of plant life and the breeding of a race horse. The parents of the seeds have to be selecte with just as much regard to their strength, maturit and fitness. The more thoroughly this great selectiv and cross-fertilising work is done the greater will the reward. And it is precisely here that the see buyer gets value when coming to a big seed hou

CALENDAR OF GARDEN OPERATIONS

New and enlarged Edition just issued.

Indispensable to Cottage Gardeners, Allotment Holders and Amateur Gardeners.

Price 6d.; post free, 8d.

Press Notices.

"It is a concise and practical manual, from which possessors of small gardens in country or town may obtain much useful advice and guidance."—*Nature.*

"A vast improvement on the numerous editions which have been issued, and can be highly commended for those who lecture on horticultural subjects."
—*Journal of the British Gardeners' Association.*

"This book has had an enormous sale—a fact which is not surprising considering the splendid value given for the low price charged—sixpence. The new edition is well illustrated and contains new chapters on 'French Gardening,' and on the cultivation of trees in towns."
—*The Nurseryman and Seedsman.*

"There is no better sixpennyworth of guide to amateur dening on a small scale."—*The Westminster Gazette.*

"The information given covers every department of lening operations, so the Guide should prove of great ance to all who are interested in any branch of the ct. The advice is conveyed in a concise, practical, imple manner, and the value of the text is greatly nced by the number of excellent illustrations and ms which accompany it. Every amateur can be l of finding something to interest and instruct in a of the pages of this work, and the 'Calendar' ot fail to find a prominent place on his bookshelf."
—*The Observer.*

"… are fa… valuable work for the amateur gardener."
—*The Lady.*

"Cottage gardeners, allotment holders, and amateur gardeners will find it a very useful handbook to consult."
—*The Gentlewoman.*

"Offers to all who possess even the smallest piece of ground, complete guidance as to what to plant and how to plant for every season of the year."
—*Universe and Catholic Weekly.*

"Is an excellent compendium for the use of cottage gardeners, allotment holders, and amateur gardeners."
—*The Christian.*

"One of the most important and invaluable books for the amateur to possess in particular is a good calendar, and in the work under review, this want is supplied in a most comprehensive manner."—*Purley Gazette.*

"It is full of interesting and general information as to the growing of fruit, flowers, and vegetables, and how to protect them from destructive garden pests."
—*The Western Daily Press.*

"The information with which the 170 pages are crammed has been brought thoroughly up to date, and chapters added on the cultivation of trees and shrubs in towns and on 'intensive culture,' as vegetable forcing is now termed."
—*Norwich Chronicle.*

"Copiously illustrated and free from technicalities, it should command a ready sale and unstinted appreciation."
—*Manchester Weekly Times.*

"The amateur gardener and the small holder will find it a most useful little book."
—*The Yorkshire Weekly Post.*

"A handbook of practical information prepared by experts associated with the GARDENERS' CHRONICLE."
—*he Scotsman.*

"Cottage gardeners, allotment holders and amateur gardeners will find the book of service."
—*The Dundee Advertiser.*

"Gives instructions in regard to operations connected with vegetables, fruit and flowers for the different months of the year; and there follow a number of valuable articles on special subjects."—*Aberdeen Journal.*

"As a guide and instructor to amateurs, this calendar is invaluable, and few volumes give as good value for sixpence."—*Irish Gardening.*

"It is excellent value for the money."
—*Cork Constitution.*
